# Preface

The HAWC2 code is a code intended for calculating wind turbine response in time domain. It has been developed within the years 2003-2006 at the aeroelastic design research programme at Risoe, National laboratory Denmark.

The structural part of the code is based on a multibody formulation where each body is an assembly of timoshenko beam elements. The formulation is general which means that quite complex structures can be handled and arbitrary large rotations of the bodies can be handled. The turbine is modeled by an assembly of bodies connected with constraint equations, where a constraint could be a rigid coupling, a bearing, a prescribed fixed bearing angle etc. The aerodynamic part of the code is based on the blade element momentum theory, but extended from the classic approach to handle dynamic inflow, dynamic stall, skew inflow, shear effects on the induction and effects from large deflections. Several turbulence formats can be used. Control of the turbine is performed through one or more DLL's (Dynamic Link Library). The format for these DLL's is also very general, which means that any possible output sensor normally used for data file output can also be used as a sensor to the DLL. This allows the same DLL format to be used whether a control of a bearing angle, an external force or moment is placed on the structure.

The code has internally at Risoe been tested against the older validated code HAWC, the CFD code Ellipsys and numerous measurements. Further on detailed verification is performed in the IEA annex 23 and annex 30 research project regarding offshore application. Scientific papers involving the HAWC2 is normally posted on the www.hawc2.dk homepage, where the code, manual and more can be downloaded.

During the programming of the code a lot of focus has been put in the input checking so hopefully meaningful error messages are written to the screen in case of lacking or obvious erroneous inputs. However since the code is still constantly improved we appreciate feedback from the users – both good and bad critics are welcome.

The manual is also constantly updated and improved, but should at the moment cover the description of available input commands.

# Acknowledgements

The code has been developed primarly by internal funds from Risø National Laboratory – Technical University of Denmark, but the research that forms the basis of the code is mainly done under contract with the Danish Energy Authority.

The structural formulation of the model is written by Anders M. Hansen as well as the solver and the linking between external loads and structure. The aerodynamic BEM module is written by Helge A. Madsen and Torben J. Larsen. Three different stall models are implemented where the S.Ø. (Stig Øye) model is implemented by Torben J. Larsen, the mhh Beddoes model is written by Morten Hansen and Mac Gaunaa and the ateflap model used for trailing edge flaps is written by Mac Gaunaa and Peter Bjørn Andersen and has later been rewritten by Leonardo Bergami. The wind and turbulence module as well as the soil and DLL modules are written by Torben J. Larsen. The hydrodynamic module is written by Anders M. Hansen and Torben J. Larsen. The turbulence generator is written by Jacob Mann and the WAsP Team and converted into a DLL by Peter Bjørn Andersen. The dynamic wake meandering module is written by Helge A. Madsen, Gunner Larsen and Torben J. Larsen. The eigenvalue solver is implemented by Anders M. Hansen and John Hansen. General maintenance is performed by Torben J. Larsen and Anders M. Hansen. The web page <u>www.hawc2.dk</u> is maintained by Anders Yde.

# **General input layout**

The HAWC 2 input format is written in a form that forces the user to write the input commands in a structured way so aerodynamic commands are kept together, structural commands the same etc.

The commands are divided into command blocks using the begin-end syntax. Each line has to be ended with a semi colon ";" which gives the possibility for writing comments and the end of each line after the semi colon. All command lines can be written with capital or small letters, but inside the code all lines are transformed into small letters. This could have importance if something case sensitive is written (e.g. the name of a subroutine within a DLL).

```
begin simulation;
                100.0 ;
  time_stop
  solvertype
                1;
                        (newmark)
;
  begin newmark;
               0.27;
    beta
    qamma
               0.51:
    deltat
               0.02;
  end newmark;
end simulation;
```

In the next chapters the input commands are explaned for every part of the code. The notation is main command for a begin-end command block that is not a sub part of another begin-end block, and sub command block for a begin-end block that is included within another block. In the above written example "simulation" is a main command block and "newmark" is a sub command block.

# Continue\_in\_file option

A feature from version 6.0 and newer is the possibility of continuing reading of the main input file into another. The command word **continue\_in\_file** followed by a file name causes the program to open the new file and continue reading of input until the command word **exit**. When **exit** is read the reading will continue in the previous file. An infinite number of file levels can be used.

Command name	Explanation			
continue_in_file	1. File name (and path) to sublevel input file			
exit	End of input file. Input reading is continued in highe level input file.			

# HAWC2 version handling

The HAWC2 code is still frequently updated and version handling is therefore of utmost importance to ensure quality control. For every new released version of the code a new version number is hard coded in the source. This number can be found by executing the HAWC2.exe file without any parameters. The version number is echoed to screen. The same version number is also written to every result file no matter whether ASCII or binary format is chosen. Hereby it is possible to reproduce all results at later stage and to dig in the source code for at previous version if special problems occur.

All information covering the different code versions has been made. These data are listed on the next pages.

Version information: Version name	! Date	Resp	Info
 global%version='HAWC2MB 1.0'	! 20.04.2006	TJUL	Version system started. Changes in so_dyn_stall model performed.
C .	! 24.04.2006	TJUL/ANMH	Bearing3 in topology - slight modification still needed, but now mhh needs a version

!	global%version='HAWC2MB 3.3'	! 04.08.2006	TJUL	Check applied on exp expressions in dynamic stall mhh model to avoid
				underflow errors
!	global%version='HAWC2MB 3.4'	! 09.08.2006	TJUL	New check applied in mann turbulence unit to avoid array out of bounds
1		! 11.08.2006	TJUL	during bizar startup transients Correction of exp check in dynstall_mhh model just created in version
•		: 11.00.2000	IJUL	3.2
!	global%version='HAWC2MB 3.5'	! 28.08.2006	TJUL	Generator_rotation sensor setup for old_htc_structure format - replaces
				the older tmp_gen_speed sensor. Updates in hawcstructure.f90 and
				body_output.f90
!		!		New error message in body_output
1		!		Improvement of general command reader in genout_tools in order to accept tabulator spacings
		!		General shine up of aerodynamic calculations regarding induction and
				tiploss calculations rechecked against IEA rev 3 calculations
		!		Number of radial point in the induction calculation is default set to
				the name number as number of aero sections. Previous default of 30
		1		stations
		!		Linear interpolation in aeroload_tools updated so no division by zero occurs when x0=x1, used in cases where extrapolation is not wanted
		! 29.08.2006	ANMH/TJUL	Fix1 constraints updated in topologi_constraints_fix1.f90 and
		. 2010012000	,,	hawcstructure.f90. Ensures e.g. that constraint properties are
				identical for blades. Ensures that blades performs identically.
!	global%version='HAWC2MB 3.6'	! 14.09.2006	TJUL	New acceptance criteria from license manager
!	global%version='HAWC2MB 3.7'	! 15.09.2006	TJUL ANMH/TJUL	New general load linker that replaces bladelink.f90 and wavelink.f90
		!	ANME/ IJUL	Pitchsensors (bearing sensor) updated during iterations too. Especially important for DLL controllers
!	global%version='HAWC2MB 3.8'	! 06.10.2006	TJUL	Correction of bug related to aero int_force and int_moment sensors
	g	!		Correction of bug in DLL actions. On nodes different from nr. 1, in-
				and external forces and moments were placed on the node 1 number lower.
		!	TJUL	Pitch sensor modified. Now pitch velocity is clculated based on
				numerical differentiation of calculated angle. Should be less sensitive
		!	TJUL	to solver inaccuracies. In output of boaring soncer new options are added ( 180:180 deg output
		:	IJUL	In output of bearing sensor new options are added. (-180:180 deg output etc.)
		!	ANMH	Correction of bug in loadlinker. It turned out that loadfunction were
				only correct if an even number of calculation points were used (aero or
				hydro). Now OK also for odd numbers
!	global%version='HAWC2MB 3.9'	! 06.10.2006	TJUL	Soil spring module added (soil stuff from hydro module removed)
!	global%version='HAWC2MB 4.0' global%version='HAWC2MB 4.1'	! 02.11.2006 ! 02.11.2006	TJUL ANMH/TJUL	Extra output commands in aero output_at Replacement of added stiffness method for soil springs. Much better and

	! 22.07.2014	TJUL	Dyn stall MHH model rolled back to version 11.5. The modification in
			11.6 wrt. VAWT affected HAWT operation. A better dyn stall model for
			VAWT must be coded
	! 22.07.2014	TJUL/ANYD/MMPE	Comprehensive testprogram established. Used on this version and future.

# **Coordinate systems**

The global coordinate system is located with the z-axis pointing vertical downwards. The x and y axes are horizontal to the side.

When wind is submitted, the default direction is along the global y-axes. Within the wind system meteorological u,v,w coordinates are used, where u is the mean wind speed direction, v is horizontal and w vertical upwards. When x,y,z notation is used within the wind coo. this refers directly to the u,v,w definition.

Every substructure and body (normally the same) is equipped with its own coordinate system with origo in node1 of this structure. The structure can be arbitrarily defined regarding orientation within this coordinate system. Within a body a number of structural elements are present. The orientation of coordinate systems for these elements are chosen automatically by the program. The local z axis is from node 1 to 2 on the element.

The coordinate system for the blade structures must be defined with the z axis pointing from the blade root and outwards, x axis in the tangential direction of rotation and y axis from the pressure side towards the suction side of the blade profiles. This is in order to make the linkage between aerodynamics and structure function.

In order to make a quick check of the layout of the structure the small program "animation.exe" can be used (this requires than an animation file has been written using the command animation in the Simulation block). The view option in this program is handled by keyboard hotekeys:

#### Animation Hotkeys:

translate: (shift)+{x,y,z} rotate: arrow keys rotate about line-of-sight: ctrl+left/right zoom in: ctrl+up zoom out: ctrl+down amplify displacement (only usefull for animation of natural frequencies): + decrease displacement (only usefull for animation of natural frequencies): -

If the animation does not start, press "s"

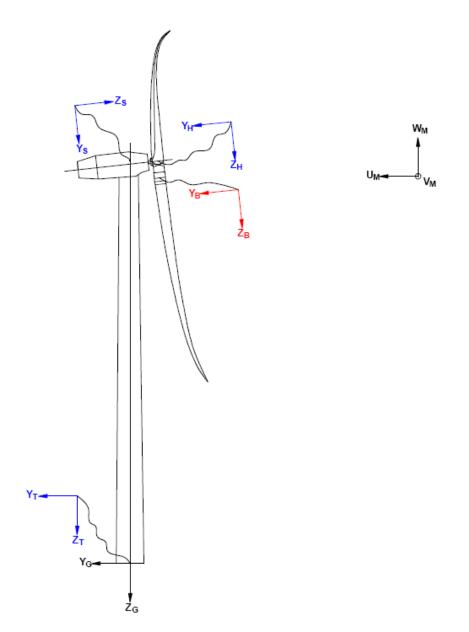

Figure 1. Illustration of coordinate system as result of user input from example in section Example of main input file at page 101. There are two coordinate systems in **black** which are the default coordinate systems of global reference and default wind direction. The **blue** coordinate systems are main body coordinate systems attached to node 1 of the substructure, the orientation of these are fully determined by the user. The **red** coordinate systems are also defined by the user, but in order to make the linkage between aerodynamic forces and structure work these have to have the z from root to tip, x in chordwise direction and y towards the suction side.

# Simulation

# Main command block - Simulation

Obl.	Command name	Explanation
*	time_stop	1. Simulation length [s]
	solvertype	1. Choice of available solver method (1=newmark)
	solver_relax	1. Relaxation parameter on increment within a timestep. Can be used to make difficult simulation run through solver when parameter is decreased, however on the cost of simulation speed.
		Default=1.0
	on_no_convergence	Parameter that informs solver of what to do if convergence is not obtained in a time step.
		<ol> <li>'stop': simulation stops – default. 'continue': simulation continues, error message is written.</li> </ol>
	convergence_limits	Convergence limits that must be obtained at every time step.
		1. epsresq, residual on internal-external forces, default=10.0
		<ol> <li>epsresd, residual on increment, default=1.0</li> <li>epsresg, residual on constraint equations, default=1E-7</li> </ol>
	max_iterations	1. Number of maximum iterations within a time step.
	animation	Included if animation file is requested 1. Animation file name incl. relative path. E.g. ./animation/animation1.dat
	logfile	Included if a logfile is requested internally from the htc command file. 1. Logfile name incl. relative path. E.g. ./logfiles/log1.txt

This block shall be present when time simulations are requested – always.

# Sub command block – newmark

This block shall be present when the solvertype is set to the newmark method.

Obl.	Command name	Explanation
	beta	1. beta value (default=0.27)
	gamma	1. gamma value (default=0.51)
*	deltat	1. time increment [s]
	symmetry	<ol> <li>Solver assumtion regarding mass, damping and stiffness matrices (1=symmetric (default), 2=assymetric (recommended for offshore structures). When hydrodynamic loading is applyed this parameter will automatically change to 2.)</li> </ol>

# **Structural input**

# Main command block – new\_htc\_structure

	command block – new_m	
Obl.	Command name	Explanation
	beam_output_file_name	1. Filename incl. relative path to file
		where the beam data are listed (output)
		(example ./info/beam.dat)
	body_output_file_name	1. Filename incl. relative path to file
		where the body data are listed (output)
		(example ./info/body.dat)
	struct inertia output file name	1. Filename incl. relative path to file
		where the global inertia information
		data are listed (output) (example
		./info/inertia.dat)
	body eigenanalysis file name	1. Filename incl. relative path to file
		where the results of an eigenanalysis
		are written. (output) (example
		./info/eigenfreq.dat)
	constraint output file name	1. Filename incl. relative path to file
	constraint_output_ine_nume	where the constraint data are listed
		(output). (example ./info/constraint.dat)
	structure eigenanalysis file name	1. Filename incl. relative path to file
	structure_engenunurysis_inte_nunte	where the results of an complete
		turbine eigenanalysis are listed
		(example ./info/eigen all.dat).
		Animation files of the first modes are
		places in same directory as the
		HAWC2 executable.
		2. Optional parameter determining if
		structural damping is included in the
		eigenvalue calculation or not.
		(0=damping not included, most robust
		method, 1=damping included default)
	system_analysis	Eigenvalue calculation of the total system
	system_anarysis	including external systems attached, eg.
		mooring lines. Constraint equations are also
		fully included in the analysis.
		1. Filename incl. relative path to file
		where the results of an complete
		turbine eigenanalysis are listed
		(example ./info/eigen all.dat).
		Animation files of the first modes are
		places in same directory as the
		HAWC2 executable.
		2. (optional) Parameter determining if
		structural damping is included in the
		eigenvalue calculation or not.
		(0=damping not included, most robust
		method, 1=damping included default)
		3. (optional) Number of modes outputted.
		4. (optional) Time for when the eigen
		analysis is carried out. Eg. after a
		settling of a floating system.
L		sound of a noaning system.

# Sub command block – main\_body

This block can be repeated as many times as needed. For every block a new body is added to the structure. A main body is a collection of normal bodies which are grouped together for bookkeeping purposes related to input output. When a main 24 Risø-R-1597(ver. 4-1)(EN)

body consist of several bodies the spacing the name of each body inherits the name of the master body and is given an additional name of '\_#', where # is the body number. An example could be a main body called 'blade1' which consist of two bodies. These are then called 'blade1\_1' and blade1\_2' internally in the code. The internal names are only important if (output) commands are used that refers to the specific body name and not the main body name.

From version 11.6 it is possible to attach an encrypted DLL where the blade data can be extracted. An example of how to encrypt this can be obtained by request through the <u>www.hawc2.dk</u> web page.

Obl.	Command name	Explanation
*	name	1. Main_body identification name (must be unique)
*	type	1. Element type used (options are: timoschenko)
*	nbodies	<ol> <li>Number of bodies the main_body is divided into (especially used for blades when large deformation effetcs needs attention). Equal number of elements on each body, eventually extra elements are placed on the first body.</li> </ol>
*	node_distribution	<ol> <li>Distribution method of nodes and elements. Options are:</li> <li>"uniform" nnodes. Where uniform ensures equal element length and nnodes are the node numbers.</li> <li>"c2_def", which ensures a node a every station defined with the sub command block c2_def.</li> </ol>
	damping	Original damping model that can only be used when the shear center location equals the elastic center to ensure a positive definite damping matrix. It is recommended to use the <b>damping_posdef</b> command instead. Rayleigh damping parameters containing factors that are multiplied to the mass and stiffness matrix respectfully. ! Pay attention, the mass proportial damping is not contributing when a mbdy consist of multiple bodies ! 1. M <sub>x</sub> 2. M <sub>y</sub> 3. M <sub>z</sub> 4. K <sub>x</sub> 5. K <sub>y</sub> 6. K <sub>z</sub>
	damping_posdef	Rayleigh damping parameters containing factors. $M_x$ , $M_y$ , $M_z$ are constants multiplied on the mass matrix diagonal and inserted in the damping matrix. $K_x$ , $K_y$ , $K_z$ are factors multiplied on the moment of inertia $I_x$ , $I_y$ , $I_z$ in the stiffness matrix and inserted in the damping matrix. Parameters are in size approximately the same as the parameters used with the original damping model written above. ! Pay attention, the mass proportial damping is not contributiong when a mbdy consist of multiple bodies ! 1. $M_x$ 2. $M_y$ 3. $M_z$ 4. $K_x$ 5. $K_y$ 6. $K_z$
	copy_main_body	Command that can be used if properties from a previously defined body shall be copied. The name command still have to be present, all other data are overwritten. 1. Main_body identification name of main_body that is copied.
	gravity	1. Specification of gravity (directed towards $z_G$ ).

Obl.	Command name	Explanation
		NB! this gravity command only affects the present
		main body. Default=9.81 [m/s <sup>2</sup> ]
	concentrated mass	Concentrated masses and inertias can be attached to the
	_	structure. The offset distance from the node to the center of
		mass is given in the body's coordinates system. The
		moments and products of inertia is given around the center
		of mass in the body's coordinates system.
		1. Node number to which the inertia is attached.
		2. Offset distance x-direction [m]
		3. Offset distance y-direction [m]
		4. Offset distance z-direction [m]
		5. Mass [kg]
		6. $I_{xx} [kg m^2]$
		7. $I_{yy} [kg m^2]$
		8. $I_{zz} [kg m^2]$
		9. $I_{xy} [kg m^2] - optional$
		10. $I_{xz}$ [kg m <sup>2</sup> ] – optional
		11. $I_{vz}$ [kg m <sup>2</sup> ] – optional
	external_bladedata_dll	Blade structural data are found in an external encrypted dll.
		If this command is present only these other command lines
		need to be present (name, type, nbodies, node_distribution
		and a damping command line).
		1. Company name (that has been granted a password,
		eg. dtu).
		<ol> <li>Password for opening this specific dll, eg. test1234</li> <li>path and filename for the dll. eg.</li> </ol>
		1 8
		./data/encr_blade_data.dll

#### Sub sub command block – timoschenko\_input

Block containing information about location of the file containing distributed beam property data and the data set requested.

Obl.	Command name	Explanation
*	filename	<ol> <li>Filename incl. relative path to file where the distributed beam input data are listed (example ./data/hawc2_st.dat)</li> </ol>
*	set	<ol> <li>Set number</li> <li>Sub set number</li> </ol>

### Sub sub command block – c2\_def

In this command block the definition of the centerline of the main\_body is described (position of the half chord, when the main\_body is a blade). The input data given with the sec commands below is used to define a continous differentiable line in space using akima spline functions. This centerline is used as basis for local coordinate system definitions for sections along the structure. If two input sections are given it is assumed that all points are on a straight line. If three input sections are given points are assumed to be on the line consisted of two straight lines. If four or more input sections are given points are given points are assumed to be on an akima interpolated spline. This spline will include a straight line if a minimum of three points on this line is defined.

Position and orientation of half chord point related to main body coo.

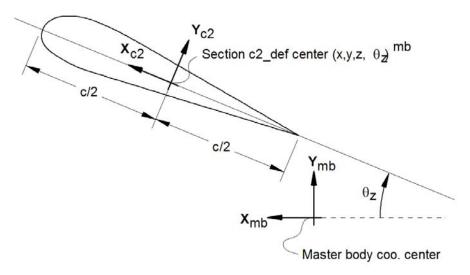

Figure 2: Illustration of c2\_def coordinate system related to main body coordinates. The blade z-coordinate has to be positive from root towards the tip.

Obl.	Command name	Explanation
*	nsec	Must be the present before a "sec" command.
		1. Number of section commands given below
*	sec	Command that must be repeated "nsec" times. Minimum 4
		times.
		1. Number
		2. x-pos [m]
		3. y-pos [m]
		4. z-pos [m]
		5. $\theta_z$ [deg]. Angle between local x-axis and
		main_body x-axis in the main_body x-y coordinate
		plane. For a straight blade this angle is the
		aerodynamic twist. Note that the sign is positive
		around the z-axis, which is opposite to traditional
		notation for etc. a pitch angle.

Here is an illustration of how a blade can be defined with respect to discretisation of bodies, nodes and elements.

Main Body: Blade1

#### Fle nt1Element2 ent18 Ele Body1 Body2 Body6 Here is an example of this written into the htc-input file. begin main\_body; blade1 ; name type timoschenko ; nbodies 6; c2\_def; node\_distribution damping\_posdef 1.17e-4 5.77e-5 6.6e-6 6.6e-4 5.2e-4 6.5e-4 ; begin timoschenko input ; filename ./data/st\_file.txt ; set 1 1 ; set subset end timoschenko\_input; Definition of centerline (main\_body coordinates) begin c2\_def; nsec 19 ; 0.000 sec 1 -0.0000 0.0000 0.000 ; sec 2 -0.0041 0.0010 3.278 -13.590 ; sec 3 -0.1048 0.0250 6.556 -13.568 ; sec 4 -0.2582 0.0492 9.833 -13.564 ; -0.4694 0.0587 sec 5 13.111 -13.546 : sec 6 -0.56890.0957 16.389 -11.406 ; sec 7 -0.5455 0.0883 19.667 -10.145 sec 8 -0.5246 0.0732 22.944 -9.043 ; sec 9 -7.843-0.4362 0.0669 26.222 ; sec 10 -0.4644 0.0554 29.500 -6.589 ; sec 11 -0.4358 0.0449 32.778 -5.447 ; -0.4859 0.0347 36.056 -4.234 sec 12 ; -0.3759 0.0265 39.333 -3.545 sec 13 ; sec 14 -0.34530.0130 42.611 -2.223; sec 15 -0.3156 0.0084 45.889 -1.553 ; sec 16 -0.2791 0.0044 49.167 -0.934 -0.2675 sec 17 0.0017 52.444 -0.454 ; -0.1785 0.0003 55.722 -0.121 sec 18 ; sec 19 -0.1213 0.0000 59.000 -0.000 ; end c2\_def ;

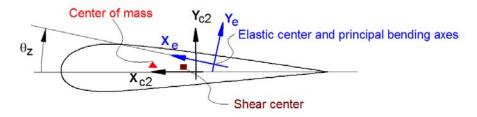

end main\_body;

#### Format definition of file including distributed beam properties

The format of this file which in the old HAWC code was known as the hawc\_st file is changed slightly for the HAWC2 new\_htc\_structure format.

In the file (which is a text file) two different datasets exist. There is a main set and a sub set. The main set is located after a "#" sign followed by the main set number. Within a main there can be as many subsets as desired. They are located after a "\$" sign followed by the local set number. The next sign of the local set number is the number of lines in the following rows that belong to this sub set.

The content of the columns in a data row is specified in the table below. In general all centers are given according to the  $C_{1/2}$  center location and all other are related to the principal bending axes.

Position of structural centers related to c2\_def section coo.

# Figure 3: Illustration of structural properties that in the input files are related to the c2 coordinate system

Column	Parameter
1	r, curved length distance from main_body node 1 [m]
2	m, mass per unit length [kg/m]
3	$x_m, x_{c2}$ -coordinate from $C_{1/2}$ to mass center [m]
4	$y_m$ , $y_{c2}$ -coordinate from $C_{1/2}$ to mass center [m]
5	$r_{ix}$ , radius of gyration related to elastic center. Corresponds to rotation about principal bending $x_e$ axis [m]
6	$r_{iy}$ , radius of gyration related to elastic center. Corresponds to rotation about principal bending $y_e$ axis [m]
7	$x_{s}$ , $x_{c2}$ -coordinate from $C_{1/2}$ to shear center [m]. The shear center is the point where external forces only contributes to pure bending and no torsion.
8	$y_{s}$ , $y_{c2}$ -coordinate from $C_{1/2}$ to shear center [m]. The shear center is the point where external forces only contributes to pure bending and no torsion.
9	E, modulus of elasticity [N/m <sup>2</sup> ]
10	G, shear modulus of elasticity [N/m <sup>2</sup> ]
11	$I_x$ , area moment of inertia with respect to principal bending $x_e$ axis $[m^4]$ . This is the principal bending axis most parallel to the $x_{c2}$ axis
12	$I_{y}$ , area moment of inertia with respect to principal bending $y_{e}$ axis $[m^{4}]$
13	K, torsional stiffness constant with respect to $z_e$ axis at the shear center $[m^4/rad]$ . For a circular section only this is identical to the polar moment of inertia.
14	k <sub>x</sub> shear factor for force in principal bending x <sub>e</sub> direction [-]
15	k <sub>y</sub> , shear factor for force in principal bending y <sub>e</sub> direction [-]
16	A, cross sectional area [m <sup>2</sup> ]

17	$\theta_s$ , structural pitch about $z_{c2}$ axis. This is the angle between the $x_{c2}$ -axis
	defined with the c2_def command and the main principal bending axis x <sub>e</sub> .
18	$x_e$ , $x_{c2}$ -coordinate from $C_{1/2}$ to center of elasticity [m]. The elastic center is
	the point where radial force (in the z-direction) does not contribute to
	bending around the x or y directions.
19	$y_e$ , $y_{c2}$ -coordinate from $C_{1/2}$ to center of elasticity [m]. The elastic center is
	the point where radial force (in the z-direction) does not contribute to
	bending around the x or y directions.

A small explanation about radius of gyration (also called radius of inertia) and the area moment of inertia (related to stiffness) is shown below in N.5 and N.11

N.5 r<sub>tx</sub> [m] Radius of inertia. Related to the Moment of Inertia I<sub>xx</sub> [kg m<sup>2</sup>], which gives the rotation inertia, resistance to change in rotation rate:

$$I_{xx} = \int r_{tx}^2 \mathrm{d}m \quad \rightarrow \quad r = \sqrt{\frac{I_{xx}}{m}} = \sqrt{\frac{I_x}{\mathrm{A}}}$$

• N.11  $I_x$  [m<sup>4</sup>] Area moment of inertia with respect to  $x_e$ . It's the second moment of area  $I_x = \int y^2 dA$ . Multiplied by Young's modulus E gives the flapwise bending stiffness:

$$\begin{aligned} \text{Stiffn}_{\text{flap}} &= E \cdot I_x = \frac{M}{\mathrm{d}^2 w / \mathrm{d}^2 x} \\ \text{Stiffn}_{\text{edge}} &= E \cdot I_y \\ \text{Stiffn}_{\text{tors}} &= \mathbf{G} \cdot \mathbf{K} \end{aligned}$$

An example of an inputfile can be seen on the next page. The most important features to be aware of are colored with red.

### Sub sub command – damping\_distributed

In this command block, Rayleigh damping parameters can be defined as function of blade length, hence damping paprameters can be different at root of tip of a blade.

Obl.	Command name	Explanation
*	nsec	Number of input lines
*	sec	This command must be repeated nsec times.
		1. r/R. Non-dim distance from node 1 to node N.
		2. k <sub>x</sub> Stiffness proportional damping around x
		3. k <sub>y</sub> Stiffness proportional damping around y
		4. k <sub>z</sub> Stiffness proportional damping around z

### Sub sub command – damping\_posdef\_distributed

In this command block, Rayleigh damping parameters can be defined as function of blade length, hence damping paprameters can be different at root of tip of a blade.

Obl.	Command name	Explanation
*	nsec	Number of input lines
*	sec	This command must be repeated nsec times.
		1. r/R. Non-dim distance from node 1 to node N.
		2. $k_x$ Stiffness proportional damping around x
		3. k <sub>y</sub> Stiffness proportional damping around y
		4. $k_z$ Stiffness proportional damping around z

### Sub command - orientation

In this command block the orientation (regarding position and rotation) of every main body are specified.

### Sub sub command - base

The orientation of a main\_body to which all other bodies are linked – directly or indirectly.

Obl.	Command name	Explanation
*	mbdy (old command name <b>body</b> still usable)	1. Main_body name that is declared to be the base of all bodies (normally the tower or foundation)
*	inipos	Initial position in global coordinates. 1. x-pos [m] 2. y-pos [m] 3. z-pos [m]
*	mbdy_eulerang (old command name <b>body_eulerang</b> still usable)	Command that can be repeated as many times as needed. All following rotation are given as a sequence of euler angle rotations. All angle can be filled in (rotation order x,y,z), but it is recommended only to give a value different from zero on one of the angles and reuse the command if several rotations are needed. 1. $\theta_x$ [deg] 2. $\theta_y$ [deg] 3. $\theta_z$ [deg]
*	body_eulerpar	The rotation is given as euler parameters (quaternions) directly (global coo). 1. $r_0$ 2. $r_1$ 3. $r_2$ 4. $r_3$
*	mbdy_axisangle	Command that can be repeated as many times as needed. A

(old command name <b>body_axisangle</b> still usable)	version of the euler parameters where the input is a rotation vector and the rotation angle of this vector. 1. x-value 2. y-value 3. z-value 4. angle [deg]
-------------------------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------

\* One of these commands must be present.

### Sub sub command - relative

This command block can be repeated as many times as needed. However the orientation of every main\_body should be described.

Obl.	Command name	Explanation
*	mbdy1	1. Main_body name to which the next main_body is
		attached.
		2. Node number of body1 that is used for connection.
	(old command name <b>body1</b> still usable)	("last" can be specified which ensures that the last
	- /	node on the main_body is used).
*	mbdy2	1. Main_body name of the main_body that is
		positioned in space by the relative command.
	(old command name	2. Node number of body2 that is used for connection.
	body2 still usable)	("last" can be specified which ensures that the last node on the main body is used).
*	mbdy2_eulerang	Command that can be repeated as many times as needed.
ele	mouy2_culturing	All following rotation are given as a sequence of euler
		angle rotations. All angle can be filled in (rotation order
		x,y,z), but it is recommended only to give a value different
		from zero on one of the angles and reuse the command if
		several rotations are needed. Until a rotation command is
		specified body2 has same coo. as body1. Rotations are
		performed in the present body2 coo. system.
		1. $\theta_x$ [deg]
	(old command name	2. $\theta_{\rm y}$ [deg]
	<b>body2_eulerang</b> still usable)	3. $\theta_{z}$ [deg]
*	mbdy2 eulerpar	The rotation is given as euler parameters (quaternions)
		directly (global coo).
		1. r <sub>0</sub>
		2. $r_1$
	(old command name	3. $r_2$
	<b>body2_eulerpar</b> still usable)	4. $r_3$
*	mbdy2 axisangle	Command that can be repeated as many times as needed. A
		version of the euler parameters where the input is a
		rotation vector and the rotation angle of this vector. Until a
		rotation command is specified main_body2 has same coo.
		as main_body1. Rotations are performed in the present
		main_body2 coo. system.
		1. x-value
	(old command name	2. y-value 3. z-value
	body2_axisangle still	3. z-value 4. angle [deg]
	usable)	
	mbdy2_ini_rotvec_d1	Initial rotation velocity of main body and all subsequent
		attached bodies. A rotation vector is set up and the size of
		vector (the rotational speed) is given. The coordinate
	(old command name	system used is main_body2 coo. 1. x-value
	body2_ini_rotvec_d1 still	2. y-value
	usable)	3. z-value
		4. Vector size (rotational speed [rad/s])
	relpos	Vector from coupling node of mbdy 1 to coupling node of
	F	mbdy 2 in mbdy2 coo system in case a certain distance
		between these nodes is required. (Default for overlapping
		coupling nodes, this vector is $(0,0,0)$
		1. x-value
		2. y-value
		3. z-value

# Sub command - constraint

In this block constraints between the main\_bodies and to the global coordinate system are defined.

### Sub sub command – fix0

This constraint fix node number 1 of a given main\_body to ground.

Obl.	Command name	Explanation
*	mbdy	Name of main body that is fixed to ground at node 1
	(old command name	
	<b>body</b> still usable)	
	disable_at	Time to which constraint can be disabled
		1. $t_0$

### Sub sub command – fix1

This constraint fix a given node on one main\_body to another main\_body's node.

Obl.	Command name	Explanation
*	mbdy1	<ol> <li>Main_body name to which the next main_body is fixed.</li> </ol>
	(old command name <b>body1</b> still usable)	<ol> <li>Node number of main_body1 that is used for the constraint. ("last" can be specified which ensures that the last node on the main body is used).</li> </ol>
*	mbdy2	<ol> <li>Main_body name of the main_body that is fixed to main_body1.</li> </ol>
	(old command name <b>body2</b> still usable)	<ol> <li>Node number of main_body2 that is used for the constraint. ("last" can be specified which ensures that the last node on the main_body is used).</li> </ol>
	disable_at	Time to which constraint can be disabled 1. $t_0$

## Sub sub command – fix2

This constraint fix a node 1 on a main\_body to ground in x,y,z direction. The direction that is free or fixed is optional.

Obl.	Command name	Explanation
*	mbdy	1. Main_body name to which node 1 is fixed.
	(old command name	
	<b>body</b> still usable)	
*	dof	Direction in global coo that is fixed in translation
		1. x-direction (0=free, 1=fixed)
		2. y-direction (0=free, 1=fixed)
		3. z-direction (0=free, 1=fixed)

#### Sub sub command – fix3

This constraint fix a node to ground in tx,ty,tz rotation direction. The rotation direction that is free or fixed is optional.

Obl.	Command name	Explanation
*	mbdy	<ol> <li>Main_body name to which node 1 is fixed.</li> <li>Node number</li> </ol>
	(old command name <b>body</b> still usable)	
*	dof	Direction in global coo that is fixed in rotation

1. tx-rot.direction (0=free, 1=fixed)2. ty-rot.direction (0=free, 1=fixed)3. tz-rot.direction (0=free, 1=fixed)	
-----------------------------------------------------------------------------------------------------------------	--

# Sub sub command – fix4

Constraint that locks a node on a body to another node in translation but not rotation with a pre-stress feature. The two nodes will start at the defined positions to begin with but narrow the distance until fully attached at time T.

Obl.	Command name	Explanation
*	mbdy1	1. Main_body name to which the next main_body is
		fixed.
		2. Node number of main_body1 that is used for the
	(old command name	constraint. ("last" can be specified which ensures
	<b>body1</b> still usable)	that the last node on the main_body is used).
*	mbdy2	1. Main_body name of the main_body that is fixed to
		body1.
		2. Node number of main_body2 that is used for the
	(old command name	constraint. ("last" can be specified which ensures
	<b>body2</b> still usable)	that the last node on the main_body is used).
	time	3. Time for the pre-stress process. Default=2sec

### Sub sub command – bearing1

Constraint with properties as a bearing without friction. A sensor with same identification name as the constraint is set up for output purpose.

Obl.	Command name	Explanation
*	name	1. Identification name
*	mbdy1	1. Main_body name to which the next main_body is
		fixed with bearing1 properties.
		2. Node number of main_body1 that is used for the
	(old command name	constraint. ("last" can be specified which ensures
	<b>body1</b> still usable)	that the last node on the main_body is used).
*	mbdy2	1. Main_body name of the main_body that is fixed to
		body1 with bearing1 properties.
		2. Node number of main_body2 that is used for the
	(old command name	constraint. ("last" can be specified which ensures
	body2 still usable)	that the last node on the main_body is used).
*	bearing_vector	Vector to which the free rotation is possible. The direction
		of this vector also defines the coo to which the output angle
		is defined.
		1. Coo. system used for vector definition
		(0=global,1=mbdy1,2=mbdy2)
		2. x-axis
		3. y-axis
		4. z-axis
	disable_at	Time to which constraint can be disabled
		1. t <sub>0</sub>

### Sub sub command – bearing2

This constraint allows a rotation where the angle is directly specified by an external dll action command.

Obl.	Command name	Explanation	
*	name	1. Identification name	
*	mbdy1	1. Main_body name to which the next main_body is	
		fixed with bearing2 properties.	
		2. Node number of main_body1 that is used for the	
	(old command name	constraint. ("last" can be specified which ensures	
	<b>body1</b> still usable)	that the last node on the main_body is used).	
*	mbdy2	1. Main_body name of the main_body that is fixed to	
		main_body1 with bearing1 properties.	
		2. Node number of main_body2 that is used for the	
	(old command name	constraint. ("last" can be specified which ensures	
	<b>body2</b> still usable)	that the last node on the main_body is used).	
*	bearing_vector	Vector to which the rotation occur. The direction of this	
		vector also defines the coo to which the output angle is	
		defined.	
		1. Coo. system used for vector definition	
		(0=global,1=mbdy1, 2=mbdy2)	
		2. x-axis	
		3. y-axis	
		4. z-axis	
	disable_at	Time to which constraint can be disabled	
		1. t <sub>0</sub>	

### Sub sub command – bearing3

This constraint allows a rotation where the angle velocity is kept constant throughout the simulation.

Obl.	Command name	Explanation
*	name	1. Identification name
*	mbdy1	1. Main_body name to which the next main_body is
		fixed with bearing3 properties.
		2. Node number of main_body1 that is used for the
	(old command name	constraint. ("last" can be specified which ensures
	body1 still usable)	that the last node on the main_body is used).
*	mbdy2	1. Main_body name of the main_body that is fixed to
		body1 with bearing3 properties.
		2. Node number of main_body2 that is used for the
(	(old command name <b>body2</b> still usable)	constraint. ("last" can be specified which ensures
	• •	that the last node on the main_body is used).
*	bearing_vector	Vector to which the rotation occur. The direction of this
		vector also defines the coo to which the output angle is
		defined.
		1. Coo. system used for vector definition
		(0=global,1=body1,2=body2)
		2. x-axis
		3. y-axis
		4. z-axis
*	omegas	1. Rotational speed [rad/sec]

#### Sub sub command – bearing4

This constraint is a cardan shaft constraint. Locked in relative translation. Locked in rotation around one vector and allows rotation about the two other directions.

Obl.	Command name	Explanation	
*	name	1. Identification name	
*	mbdy1	1. Main_body name to which the next main_body is	
	-	fixed with bearing3 properties.	
		2. Node number of main_body1 that is used for the	
	(old command name	constraint. ("last" can be specified which ensures	
	<b>body1</b> still usable)	that the last node on the main_body is used).	
*	mbdy2	1. Main_body name of the main_body that is fixed to	
		body1 with bearing3 properties.	
		2. Node number of main_body2 that is used for the	
	(old command name	constraint. ("last" can be specified which ensures	
	body2 still usable)	that the last node on the main_body is used).	
*	bearing_vector	Vector to which the rotation is locked. The rotation angle	
		and velocity can be outputted around the two perpendicular	
		directions.	
		1. Coo. system used for vector definition	
		(0=global,1=mbdy1, 2=mbdy2)	
1		2. x-axis	
1		3. y-axis	
		4. z-axis	

#### Sub sub command – bearing5

This constraint is a spherical constraint. Locked in relative translation. Free in rotation around all three axis, but only sensor on the main rotation direction.

Obl.	Command name	Explanation	
*	name	1. Identification name	
*	mbdy1	1. Main_body name to which the next main_body is	
		fixed with bearing3 properties.	
		2. Node number of main_body1 that is used for the	
	(old command name	constraint. ("last" can be specified which ensures	
	<b>body1</b> still usable)	that the last node on the main_body is used).	
*	mbdy2	1. Main_body name of the main_body that is fixed to	
		body1 with bearing3 properties.	
		2. Node number of main_body2 that is used for the	
	(old command name	constraint. ("last" can be specified which ensures	
	body2 still usable)	that the last node on the main_body is used).	
*	bearing_vector	Vector to which the rotation is locked. The rotation angle	
		and velocity can be outputted around the two perpendicular	
		directions.	
		1. Coo. system used for vector definition	
		(0=global,1=mbdy1, 2=mbdy2)	
		2. x-axis	
		3. y-axis	
		4. z-axis	

# **DLL control**

This block contains the possible Dynamic Link Library formats accessible for the user. The Dll's are mainly used to control the turbine speed and pitch, but since the DLL format is very general, other use is possible too e.g. external loading of the turbine. Since the HAWC2 core has no information about external stiffness or inertia we have experienced some issues with the solver if the DLL includes high stiffness terms or especially large inertia terms. The new type2\_dll interface is slightly more stable related to the solver than the hawc dll interface.

#### Main command block – dll

So far only one DLL format is available, which is the hawc\_dll format listed below.

#### Sub command block – hawc\_dll

In the HAWC\_DLL format a subroutine within an externally written DLL is setup. In this subroutine call two one-dimensional arrays are transferred between the HAWC2 core and the DLL procedure. The first contains data going from the HAWC2 core to the DLL and the other contains data going from the DLL to the core. It is very important to notice that the data are transferred between HAWC2 and the DLL in every timestep <u>and</u> every iteration. The user should handle the iteration inside the DLL.

Two more subroutines are called if they are present inside the dll file:

The first is an initialisation call including a text string written in the init\_string in the commands below. This could be the name of a file holding local input parameters to the data transfer subroutine. This call is only performed once. The name of this subroutine is the same name as the data transfer subroutine defined with the command *dll\_subroutine* below with the extra name '\_init', hence is the data transfer subroutine is called 'test', the initialisation subroutine will be 'test\_init'.

The second subroutine is a message exchange subroutine, where messages written in the DLL can be send to the HAWC2 core for logfile writing. The name of this subroutine is the same name as the data transfer subroutine defined with the command *dll\_subroutine* below with the extra name '\_message', hence is the data transfer subroutine is called 'test', the initialisation subroutine will be 'test\_message'.

The command block can be repeated as many times as desired. Reference number to DLL is same order as listed, starting with number 1. However it is recommended to refer the DLL using the name feature which in many cases can avoid confusion.

Obl.	Command name	Explanation	
	name	1. Reference name of this DLL (to be used with DLL	
		output commands)	
*	filename	1. Filename incl. relative path of the DLL	
		(example ./DLL/control.dll)	
*	dll_subroutine	1. Name of subroutine in DLL that is addressed	
		(remember to specify the name in the DLL with	
		small letters!)	
*	arraysizes	1. size of array with outgoing data	
		2. size of array with ingoing data	
	deltat	1. Time between dll calls. Must correspond to the	
		simulation sample frequency or be a multiple of	
		the time step size. If deltat=0.0 or the deltat	
		command line is omitted the HAWC2 code calls	
		the dll subroutine at every time step.	
	init string	1. Text string (max 256 characters) that will be	
		transferred to the DLL through the subroutine	
		'subroutine_init'. Subroutine is the name given in	
		in the command dll subroutine. No blanks can be	
		included.	

#### Sub command block – type2\_dll

This dll interface is an updated slightly modified version of the hawc\_dll interface. In the TYPE2\_DLL format a subroutine within an externally written DLL is setup. In this subroutine call two one-dimensional arrays are transferred between the HAWC2 core and the DLL procedure. The first contains data going from the HAWC2 core to the DLL and the other contains data going from the DLL to the core. It is very important to notice that the data are transferred between HAWC2 and the DLL in the first call of every timestep where the out-going variables are based on last iterated values from previous time step. The sub command **output** and **actions** are identical for both the hawc\_dll and the type2\_dll interfaces.

In the dll connected with using the type2\_dll interface two subroutines should be present. An *initialization* routine called only once before the time simulation begins, and an *update* routine called in every time step. The format in the calling of these two subroutines are identical where two arrays of double precision is exchanged. The subroutine uses the **cdecl** calling convention.

Obl.	Command name	Explanation
	name	1. Reference name of this DLL (to be used with DLL output commands)
*	filename	1. Filename incl. relative path of the DLL (example ./DLL/control.dll)
*	dll_subroutine_init	<ol> <li>Name of initialization subroutine in DLL that is addressed (remember to specify the name in the DLL with small letters!)</li> </ol>
*	dll_subroutine_update	<ol> <li>Name of subroutine in DLL that is addressed at every time step (remember to specify the name in the DLL with small letters!)</li> </ol>
*	arraysizes_init	<ol> <li>size of array with outgoing data in the initialization call</li> <li>size of array with ingoing data in the initialization</li> </ol>

			call
*	arraysizes_update	1.	size of array with outgoing data in the update call
		2.	size of array with ingoing data in the update call
	deltat	1.	Time between dll calls. Must correspond to the
			simulation sample frequency or be a multiple of
			the time step size. If deltat=0.0 or the deltat
			command line is omitted the HAWC2 code calls
			the dll subroutine at every time step.

when using the type2\_dll interface the values transferred to the DLL in the initialization phase is done using a sub command block called **init**. The commands for this subcommand block is identical to the **output** subcommand explained below, but only has the option of having the *constant* output sensor available. An example is given for a small dll that is used for converting rotational speed between high speed and low speed side of a gearbox.:

```
begin dll;
 begin type2_dll;
    name hss_convert;
    filename ./control/hss_convert.dll ;
    arraysizes_init 3 1;
    arraysizes_update 2 2 ;
    begin init;
      constant 1 2.0 ;
                            number of used sensors - in this case only 1
      constant 2 35.110;
                            gearbox ratio
      constant 3 35.110;
                           gearbox ratio
    end init:
    begin output;
      constraint bearing1 shaft_rot 2 only 2 ;
                                                   rotor speed in rpm
      constraint bearing1 shaft_rot 3 only 2 ;
                                                   rotor speed in rad/s
    end output;
    begin actions;
      rotor speed in rpm * gear_ratio
rotor speed in rad/s * gear_rat
                               gear_ratio
    end actions;
 end type2_dll;
end dll
```

#### Sub command block - output

In this block the same sensors are available as when data results are written to a file with the main block command **output**, see page 80++. The order of the sensors in the data array is continuously increased as more sensors are added.

#### Sub command block - actions

In this command block variables inside the HAWC2 code is changed depending of the specifications. This command block can be used for the hawc\_dll interface as well as the type2\_dll interface. An action commands creates a handle to the HAWC2 model to which a variable in the input array from the DLL is linked.

Obl.	Command name	Explanation
	aero beta	The flap angle beta is set for a trailing edge flap section (is the mhhmagf stall model is used). The angle is positive towards the pressure side of the profile. Unit is [deg] 1. Blade number 2. Flap section number
	body force_ext	An external force is placed on the structure. Unit is [N]. 1. body name 2. node number 3. componet (1 = F <sub>x</sub> , 2 = F <sub>y</sub> , 3 = F <sub>z</sub> )

!NB in the command name two separate words are present.

Obl.	Command name	Explanation
	body moment_ext	An external moment is placed on the structure.
		Unit is [Nm].
		1. body name
		2. node number
		3. component $(1 = M_x, 2 = M_y, 3 = M_z)$
	body force int	An external force with a reaction component is
		placed on the structure. Unit is [N].
		1. body name for action force
		2. node number
		3. component $(1 = F_x, 2 = F_y, 3 = F_z)$
		4. body name for reaction force
		5. Node number
	body moment int	An external moment with a reaction component is
	body moment_int	placed on the structure. Unit is [N].
		1. body name for action moment
		2. node number
		3. component $(1 = M_x, 2 = M_y, 3 = M_z)$
		4. body name for reaction moment
		5. Node number
	body bearing angle	A bearing either defined through the new structure
	body bearing_angle	format through bearing2 or through the old
		structure format (spitch1=pitch angle for blade 1,
		spitch2=pitch angle for blade 2,). The angle
		limits are so far [0-90deg].
		1. Bearing name
	mbdy force ext	An external force is placed on the structure. Unit is
	mody force_ext	[N].
		1. main body name
		2. node number on main body
		3. component $(1 = F_x, 2 = F_y, 3 = F_z)$ , if
		negative number the force is inserted with
		opposite sign.
		4. coordinate system (possible options are:
		mbdy name,"global","local"). "local"
		means local element coo on the inner
		element (on the element indexed 1 lower
		that the node number). One exception if
		node number =1 then the element nr. also
		equals 1.
	mbdy moment ext	An external moment is placed on the structure.
		Unit is [Nm].
		1. main body name
		2. node number on main body
		3. component $(1 = M_x, 2 = M_y, 3 = M_z)$ , if
		negative number the moment is inserted
		with opposite sign.
		4. coordinate system (possible options are:
		mbdy name,"global","local"). "local"
		means local element coo on the inner
		element (on the element indexed 1 lower
		that the node number). One exception if
		node number $=1$ then the element nr. also
		equals 1.
	<u> </u>	vyuuis 1.

Obl.	Command name	Explanation
	mbdy force_int	An internal force with a reaction component is
		placed on the structure. Unit is [N].
		1. main body name for action force
		2. node number on main body
		3. component $(1 = F_x, 2 = F_y, 3 = F_z)$ , if
		negative number the force is inserted with
		opposite sign.
		4. coordinate system (possible options are:
		mbdy name,"global","local"). "local"
		means local element coo on the inner
		element (on the element indexed 1 lower
		that the node number). One exception if
		node number $=1$ then the element nr. also
		equals 1.
		5. main body name for reaction force
		6. Node number on this main body
	mbdy moment_int	An internal force with a reaction component is
		placed on the structure. Unit is [Nm].
		1. main body name for action moment
		2. node number on main body 3. component $(1 = M_x, 2 = M_y, 3 = M_z)$ , if
		3. component $(1 = M_x, 2 = M_y, 3 = M_z)$ , if negative number the moment is inserted
		with opposite sign.
		4. coordinate system (possible options are:
		mbdy name, "global", "local"). "local"
		means local element coo on the inner
		element (on the element indexed 1 lower
		that the node number). One exception if
		node number $=1$ then the element nr. also
		equals 1.
		5. main body name for reaction moment
		6. Node number on this main body
	constraint bearing2 angle	The angle of a bearing2 constraint is set. The angle
		limits are so far [+/-90deg].
		1. Bearing name
	body printvar	Variable is just echoed on the screen. No
		parameters.
	body ignore	<ol> <li>Number of consecutive array spaces that will be ignored</li> </ol>
	mbdy printvar	Variable is just echoed on the screen. No
		parameters.
	mbdy ignore	1. Number of consecutive array spaces that
		will be ignored
	general printvar	Variable is just echoed on the screen. No
	ļ	parameters.
	general ignore	<ol> <li>Number of consecutive array spaces that will be ignored</li> </ol>
	stop_simulation	Logical switch. If value is 1 the simulation will be stopped and output written.
	wind printvar	Variable is just echoed on the screen. No
	<b>F</b>	parameters.
	wind windspeed u	External contribution to wind speed in u-direction
		[m/s]
	wind winddir	External contribution to the wind direction (turb.
		box is also rotated) [°]

# Wind and turbulence

Obl.	Command name	Explanation
*	wsp	1. Mean wind speed in center [m/s]
*	density	1. Density of the wind [kg/m <sup>3</sup> ]
*	tint	Turbulence intensity [-].
*	horizontal_input	This command determines whether the commands above should be understood as defined in the global coordinate system (with horizontal axes) or the meteorological coordinates system (u,v,w) witch can be tilted etc. 1. (0=meteorological – default, 1=horizontal)
*	center_pos0	Global coordinates for the center start point of the turbulence box, meteorological coordinate system etc. (default should the hub center) 1. $x_G [m]$ 2. $y_G [m]$ 3. $z_G [m]$
*	windfield_rotations	<ul> <li>Orientation of the wind field. The rotations of the field are performed as a series of 3 rotations in the order yaw, tilt and roll. When all angles are zero the flow direction is identical to the global y direction.</li> <li>1. Wind yaw angle [deg], positive when the wind comes from the right, seen from the turbine looking in the -y<sub>G</sub> direction.</li> <li>2. Terrain slope angle [deg], positive when the wind comes from below.</li> <li>3. Roll of wind field [deg], positive when the wind field is rotated according to the turbulence u-component.</li> </ul>
*	shear_format	Definition of the mean wind shear 1. Shear type 0=none. !This option sets the mean wind speed to zero ! $\overline{u}(z) = 0$ 1=constant $\overline{u}(z) = c$ , 2=logarithmic $\overline{u}(z) = u_0 \frac{\log \frac{-z_0^G + z^M}{r_0}}{\log \frac{-z_0^G}{r_0}}$ , 3=power law $\overline{u}(z) = u_0 \left(\frac{-z_0^G + z^M}{-z_0^G}\right)^{\alpha}$ , 4=linear $\overline{u}(z) = u_0 \frac{\partial u}{\partial z}$ 2. Parameter used together with shear type (case of shear type: 0=dummy, 1=c, 2=r_0,
*	turb_format	$3=\alpha, 4=du/dz \text{ at center})$ 1. Turbulence format (0=none, 1=mann, 2=flex)

### Main command block -wind

Obl.	Command name	Explanation
*	tower_shadow_method	<ol> <li>Tower shadow model (0=none, 1=potential flow – default, 2=jet model, 3=potential_2 (flow where shadow source is moved and rotated with tower coordinates system). Please see section, page 57 for sub block commands.</li> </ol>
	scale_time_start	<ol> <li>Starting time for turbulence scaling [s]. Stop time is determined by simulation length.</li> </ol>
	wind_ramp_factor	Command that can be repeated as many times as needed. The wind_ramp_factor is used to calculate a factor that is multiplied to the wind speed vectors. Can be used to make troublefree cut-in situations. Linear interpolation is performed between $t_0$ and $t_{stop}$ . 1. time start, $t_0$ 2. time stop, $t_{stop}$ 3. factor at $t_0$ 4. factor at $t_{stop}$
	wind_ramp_abs	Command that can be repeated as many times as needed. The wind_ramp_abs is used to calculate a wind speed that is added to the wind speed u-component. Can be used to make wind steps etc. Linear interpolation is performed between $t_0$ and $t_{stop}$ . 1. time start, $t_0$ 2. time stop, $t_{stop}$ 3. wind speed at $t_0$ 4. wind speed at $t_{stop}$
	user_defined_shear	1. Filename incl. relative path to file containing user defined shear factors (example ./data/shear.dat)
	user_defined_shear_turbulence	1. Filename incl. relative path to file containing user defined shear turbulence factors (example ./data/shearturb.dat)

Obl.	Command name	Explana	
	iec_gust	Gust ge	nerator according to IEC 61400-1
		1.	Gust type
			'eog' = extreme operating gust
			$u(z,t) = u(z,t) - 0.37A \sin\left(\frac{3\pi(t-t_0)}{T}\right) \left(1 - \cos\frac{2\pi(t-t_0)}{T}\right)$
			'edc' = extreme direction change
			$\theta(t) = 0.5\varphi_0\left(1 - \cos\left(\frac{\pi(t-t_0)}{T}\right)\right)$
			'ecg' = extreme coherent gust
			$u(z,t) = u(z,t) + 0.5A(1 - \cos(\frac{\pi(t-t_0)}{T}))$
			'ecd' = extreme coherent gust with dir.
			change $u(z,t) = u(z,t) + 0.5A(1 - \cos(\frac{\pi(t-t_0)}{T}))$
			$\theta(t) = 0.5\varphi_0\left(1 - \cos\left(\frac{\pi(t-t_0)}{T}\right)\right)$
			'ews' = extreme wind shear
			$d = \sqrt{y_M^2 + z_M^2}$
			$u(z,t) = u(z,t) + d A \left( 1 - \cos\left(\frac{2\pi(t-t_0)}{T}\right) \right) \cos\left(\arctan 2\left(y^M, -z^M\right) - \varphi_0\right)$
			even though the 'ews' expressions do not
			match the expressions in the standard
			completely, it gives identical results
			provided a mutual power law shear is used and the A parameter is set to
			$A = \frac{2.5 + 0.2\beta\sigma_1\left(\frac{D}{\Lambda_1}\right)^{\frac{1}{4}}}{-}$
			D
			and the parameter $\varphi_0$ is set to 0, 90, 180, 270 [deg] respectively.
		2.	Amplitude A [m/s]. For the 'eog', 'edc',
		2.	'ecd' this corresponds to the parameter
			$V_{gust}$ , '0', ' $V_{cg}$ ' respectively, in the
			IEC61400-1 standard.
		3.	Angle $\varphi_0$ [deg]
		4.	Time start, $t_0[s]$
		5.	Duration T [s]

#### Sub command block - mann

Block that must be included if the mann turbulence format is chosen. Normal practice is to use all three turbulence components (u,v,w) but only the specified components are used. In 2008 the turbulence generator was linked to the code so mannturbulence can be created without using external software. The command create\_turb\_parameters will search for turbulence files with names given below, but if these are not found the turbulence will be created.

A short explanation of the parameters L and  $\alpha \epsilon^{2/3}$  and its relation to the IEC61400-1 ed. 3 standard is given:

The fundamentals of the Mann model is isotropic turbulence in neutral atmospheric conditions. The energy spectrum is given based on the Von Karman spectrum (1). In isotropic turbulence, the properties of turbulence like variance and turbulent length scale is identical for all three direction corresponding to vortex structures being circular.

$$E(k) = \alpha \varepsilon^{\frac{2}{3}} L^{\frac{5}{3}} \frac{(Lk)^4}{\left(1 + (Lk)^2\right)^{\frac{17}{6}}}$$
(1)

The relation between wave number k and frequency f is related through the mean wind speed  $\overline{U}$ .

$$k = \frac{2\pi f}{\overline{U}} \tag{2}$$

However, atmospheric conditions are <u>not</u> isotropic and the vortex structures become more elliptic in shape with longer length scale and higher variance level in the u direction. In the Mann model, this is accounted for using rapid distortion theory quantified through a shear blocking factor  $\Gamma$ . A  $\Gamma$  parameter of 0 corresponds to isotropic turbulence, whereas a higher  $\Gamma$  value is used for non-isotropic turbulence. The relation between non-isotropic and isotropic properties as function of  $\Gamma$  can be seen in Figure 4. It is normally recommended to use  $\Gamma = 3.9$  for normal atmospheric conditions. A length scale of  $L = 0.7\Lambda_1$  is recommended for normal conditions.  $\Lambda_1$  is defined as the wavelength where the longitudinal power spectral density is equal to 0.05. According to the IEC61400-1 the wavelength  $\Lambda_1$  shall be considered as a constant of 42m (above a height of 60m).

In the Mann generation of turbulence a length scale L has to be used. This is the length scale of the Von Karman spectrum (1) and therefore different than the length scale used in the Kaimal formulation (3). The energy spectrum of Kaimal is formulated

$$E(f) = \sigma^2 \frac{4L/\overline{U}}{\left(1 + 6fL/\overline{U}\right)^{\frac{5}{3}}}$$
<sup>(3)</sup>

where the input parameters are given based on the table values in

	Velocity component index ( <i>k</i> )		
	1	2	3
Standard deviation $\sigma_k$	$\sigma_1$	0,8 <i>o</i> 1	0,5 σ <sub>1</sub>
Integral scale, L <sub>k</sub>	8,1 A <sub>1</sub>	2,7 A <sub>1</sub>	0,66 A <sub>1</sub>

Table 2: Information about Kaimal length scales and standard deviation ratio from the IEC61400-1

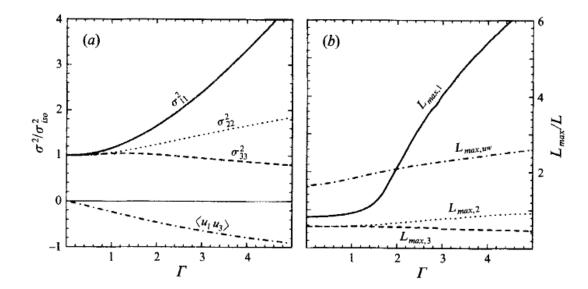

Figure 4:Turbulence characteristics compared to isotropic conditions as function of gamma parameter, Mann.. Left: Relation between variance is changed for higher shear distortions. Right: The relation between length scales are also changed for non-isotropic turbulence. It is recommended to use  $\Gamma = 3.9$  for normal atmospheric conditions. This is also the requirement in the IEC61400-1 standard. Isotropic conditions are obtained using  $\Gamma = 0$ .

The result of using  $\Gamma = 3.9$  is that the structure of the turbulence corresponds to the normal atmospheric conditions, but the actual level of turbulence is also affected as seen in *Figure 4*. It is not straight forward to give the exact analytical relationship between the input parameter  $\alpha \varepsilon^{\frac{2}{3}}$  and the final longitudinal variance and it is therefore very practical to introduce a turbulence scaling factor SF. This turbulence scaling factor is calculated based on the actual variance level in the box (normally extracted in the center of the box of longitudinal turbulence) and the target variance  $\sigma^2_{\text{target}}$  based on the requested turbulence intensity  $\sigma = Ti \ \overline{U}$ . In this case of rescaling, which is the normal usage, the input value for  $\alpha \varepsilon^{\frac{2}{3}}$  can be any arbitrary value except for zero.

$$SF = \sqrt{\frac{\sigma_{\text{target}}^2}{\sigma^2}} \tag{4}$$

The scale factor is to be multiplied to every values in the turbulence box for all the u,v and w directions. This is done automatically inside HAWC2.

Obl.	Command name	Explanation		
	create_turb_parameters	With this command, the code will search for		
		turbulence files with names given below, but if		
		these are not found the turbulence will be created		
		based on the given parameters.		
		1. Length scale L (normally L=29.4)		
		2. $\alpha \epsilon^{2/3}$ (when rescaling applied, 1.0 is normal		
		practice)		
		3. $\gamma$ (3.9 for neutral atmospheric conditions)		
		4. Seed number (any integer will do)		
		5. High frequency compensation (1=point velocity		

Obl.	Command name	Explanation		
		only represent local value which is closest to		
		anemometer measurements, recommended in		
		most cases, 0=point velocity represents average		
		velocity in grid volume)		
	filename_u	1. Filename incl. relative path to file containing		
		mann turbulence u-component		
		(example ./turb/mann-u.bin)		
	filename_v	1. Filename incl. relative path to file containing		
		mann turbulence v-component		
		(example ./turb/mann-v.bin)		
	filename_w	1. Filename incl. relative path to file containing		
		mann turbulence w-component		
		(example ./turb/mann-w.bin)		
*	box_dim_u	1. Number of grid points in u-direction		
		2. Length between grid points in u-direction [m]		
*	box_dim_v	1. Number of grid points in v-direction		
		2. Length between grid points in v-direction [m]		
*	box_dim_w	1. Number of grid points in w-direction		
		2. Length between grid points in w-direction [m]		
	std_scaling	Ratio between standard deviation for specified		
		component related to turbulence intensity input specified		
		in main wind command block.		
		If the std_scaling command is omitted, the SF is		
		determined based on the u-variance, the SF for v and w		
		direction are kept equal to u-direction (recommended)		
		1. Ratio to u-direction (default=1.0)		
		2. Ratio to v-direction (default=0.8)		
L		3. Ratio to w-direction (default=0.5)		
	dont_scale	If this command is used the normal scaling to ensure the		
		specified turbulence intensity is bypassed.		
		1. (0=scaling according to specified inputs -		
		default, 1=raw turbulence field used without		
		any scaling)		

## Sub command block - flex

Block that must be included if the flex turbulence format is chosen.

Obl.	Command name	Explanation		
*	filename_u	1. Filename incl. relative path to file containing flex		
		turbulence u-component		
		(example ./turb/flex-u.int)		
*	filename_v	1. Filename incl. relative path to file containing flex		
		turbulence v-component		
		(example ./turb/flex-v.int)		
*	filename_w	1. Filename incl. relative path to file containing flex		
		turbulence w-component		
		(example ./turb/flex-w.int)		
	std_scaling	Ratio between standard deviation for specified component		
		related to turbulence intensity input specified in main wind		
		command block.		
		1. Ratio to u-direction (default=1.0)		
		2. Ratio to v-direction (default=0.7)		
		3. Ratio to w-direction (default=0.5)		

#### File description of a user defined shear

In this file a user defined shear used instead, or in combination with one of the default shear types (logarithmic, exponential...). When the user defined shear is used the name and location of the datafile must be specified with the *wind – user\_defined\_shear* command. This command specifies the location of the file and activates the user defined shear. If this shear is replacing the original default shear the command *wind – shear\_format* must be set to zero!

Only one shear can be present in a single file. The shear describes the mean wind profile of the u, v and w component of a vertical cross section at the rotor. The wind speeds are normalized with the mean wind speed defined with the command wind - wsp.

Line number	Description
1	Headline (not used by HAWC2)
2	Information of shear v-component.
	#1 is the number of columns, NC
	#2 is the number of rows, NR
3	Headline (not used by HAWC2)
4+NR	Wind speed in v-direction, normalized with u-mean.
	# NC columns
+1	Headline (not used by HAWC2)
+1+NR	Wind speed in u-direction, normalized with u-mean.
	# NC columns.
+1	Headline (not used by HAWC2)
+1+NR	Wind speed in w-direction, normalized with u-mean.
	# NC columns
+1	Headline (not used by HAWC2)
+1+NC	Horizontal position of grid points (meteorological coo)
+1	Headline (not used by HAWC2)
+1+NR	Vertical position of grid points (meteorological coo)

#### Example of user defined shear file

```
# User defined shear file
3 4 # nr_v, nr_w
                     arrav sizes
# shear_v component, normalized with U_mean
0.0 0.0 0.0
0.0 0.0 0.0
0.0 0.0 0.0
0.0 0.0 0.0
# shear_u component, normalized with U_mean

# v coordinates
-50.0
0.0
50.0
# w coordinates (zero is at ground level)
0.0
60.0
100.0
200.0
```

#### Sub command block - wakes

Block that must be included if the Dynamic Wake Meandering model is used to model the wind flow from one or more upstream turbines.

In order to make the model function, two Mann turbulence boxes must be used. One for the meandering turbulence – which is a box containing atmospheric turbulence, but generated with a course resolution in the v,w plane (grid size of 1 rotor diameter). It is important that the turbulence vectors at the individual grid points represent a mean value covering a grid cube. It is also important that the total size of the box is large enough to cover the different wake sources including their meandering path. The resolution in the u-direction should be as fine a possible. The used length scale should correspond to normal turbulence condition. The other turbulence box that is needed is a box representing the micro scale turbulence from the wake of the upstream turbine itself. The resolution of this box should be fine (e.g. 128x128 points) in the v,w plane which should only cover 1 rotor diameter. The resolution in the u direction should also be fine, but a short length of the box (e.g. 2.5Diameter) is OK, since the turbulence box is reused. The length scale for this turbulence is significantly shorter than for the other boxes since it represents turbulence from tip and root vortices mainly. A length scale of 1/16 rotor diameter seems appropriate.

The two turbulence boxed are included by the following sub commands

begin mann\_meanderturb; (parameters are identical to the normal Mann turbulence box, see above) end mann\_meanderturb; begin mann\_microturb; (parameters are identical to the normal Mann turbulence box, see above) end mann\_microturb;

TT1 ( C (1	1	1	•	· .1	0 11 1 1
The rest of the	Walze	commands are	$\sigma_{1Ven}$	in the	following table.
	ware	commands are	given	III UIC	tonowing table.

Obl.	Command name	Explanation
*	nsource	1. Number of wake sources. If 0 is used the wake module is by-passed (no source positions can be given in this case)
*		given in this case).
*	source_pos	Command that must be repeated <i>nsource</i> times. This gives the position of the wake source (hub position) in global coordinates. Wake source position given for down stream turbines are however not used in the simulations since they don't affect the target turbine. 1. x-pos [m] 2. y-pos [m] 3. z-pos [m]
*	op data	Operational conditions for the wake sources.
	op_uuu	1. Rotational speed [rad/s]
		2. Collective pitch angle [deg]. Defined positive
		according to the blade root coo, with z-axis from
	hla manantana	root towards tip.
	ble_parameters	Parameters used for the BLE model used for developing the wake deficit due to turbulent mixing. 1. k <sub>1</sub> [-], default=0.10
		2. $k_2$ [-], default=0.008
		<ol> <li>clean-up parameter (0=intermediate files are kept, 1=intermediate files are deleted), default=1</li> </ol>
	microturb_factors	Parameters used for scaling the added wake turbulence according to the deficit depth and depth derivative. 1. $k_{m1}$ [-], factor on deficit depth, default=0.60 2. $k_{m2}$ [-], factor on depth derivative, default=0.25
	tint_meander	Turbulence intensity of the meander turbulence box. If this command is not used then the default turbulence intensity from the general wind commands is used (normal use) 1. Turbulence intensity [-]
	write_ct_cq_file	File including the local axial and tangential forces (non- dim) as function of blade radius is written. 1. Filename incl. path (e.g/res/ct_cq.data)
	write_final_deficits	File with the deficits used in the correct downstream distance is written. The windspeed deficits are non-dim with the mean wind speed. 1. Filename incl. path (e.g/res/ct_cq.data)

### Sub command block – tower\_shadow\_potential

Block that must be included if the potential flow tower shadow model is chosen.

Obl.	Command name	Explanation		
*	tower_offset	The tower shadow has its source at the global coordinate z		
		axis. The offset is the base point for section 1		
		1. Offset value (default=0.0)		
*	nsec	Command that needs to present before the radius		
		commands.		
		1. Number of datasets specified by the radius		
		command.		
*	radius	Command that needs to be listed nsec times.		
		1. z coordinate [m]		
		2. Tower radius at z coordinate [m]		

#### Sub command block – tower\_shadow\_jet

Block that must be included if the model based on the boundary layer equations for a jet is chosen. This model is especially suited for downwind simulations.

Obl.	Command name	Explanation		
*	tower_offset	The tower shadow has its source at the global coordinate z		
		axis. The offset is the base point for section 1		
		1. Offset value (default=0.0)		
*	nsec	Command that needs to present before the radius		
		commands.		
		1. Number of datasets specified be the radius		
		command.		
*	radius	Command that needs to be listed nsec times.		
		1. z coordinate [m]		
		2. Tower radius at z coordinate [m]		
		3. $C_d$ drag coefficient of tower section (normally 1.0		
		for circular section, but this depends heavily on the		
		reynold number)		

#### Sub command block – tower\_shadow\_potential\_2

Block that must be included if the tower shadow method 3 is chosen. This potential model is principally similar to the potential flow model described previously but differs in the way that the shadow source is moved and rotated in space as the tower coordinate system is moving and rotating. It is also possible to define several tower sources e.g. if the tower is a kind of tripod or quattropod. Just include more tower\_shadow\_potential\_2 blocks if more sources are required.

The coordinate system that the shadow method is linked to is specified by the user, e.g. the mbdy coordinate from the tower main body. To make sure that the tower source model is always linked in the same way as the tower (could be tricky since the tower is fully free to be specified along the x,y or z axis or a combination) the base coordinate system for the shadow model is identical to the coordinates system obtained by the local element coordinates, where the z axis is always pointing from node 1 towards node 2. This is the reason that the tower radius input has to specified with positive z-values, see below.

Obl.	Command name	Explanation		
*	tower_mbdy_link	Name of the main body to which the shadow source is		
		linked.		
		1. mbdy name		
*	nsec	Command that needs to present before the radius		
		commands.		
		1. Number of datasets specified by the radius		
		command.		
*	radius	Command that needs to be listed nsec times.		
		1. z coordinate [m] (allways positive!)		
		2. Tower radius at z coordinate [m]		

#### Sub command block – tower\_shadow\_jet\_2

Block that must be included if the tower shadow method 4 is chosen. This jet model is principally similar to the jet model described previously but differs in the way that the shadow source is moved and rotated in space as the tower coordinate system is moving and rotating. It is also possible to define several tower sources e.g. if the tower is a kind of tripod or quattropod. Just include more tower\_shadow\_jet\_2 blocks if more sources are required.

The coordinate system that the shadow method is linked to is specified by the user, e.g. the mbdy coordinate from the tower main body. To make sure that the tower source model is always linked in the same way as the tower (could be tricky since the tower is fully free to be specified along the x,y or z axis or a combination) the base coordinate system for the shadow model is identical to the coordinates system obtained by the local element coordinates, where the z axis is always pointing from node 1 towards node 2. This is the reason that the tower radius input has to specified with positive z-values, see below.

Obl.	Command name	Explanation		
*	tower_mbdy_link	Name of the main body to which the shadow source is		
		linked.		
		1. mbdy name		
*	nsec	Command that needs to present before the radius		
		commands.		
		1. Number of datasets specified by the radius		
		command.		
*	radius	Command that needs to be listed nsec times.		
		1. z coordinate [m] (allways positive!)		
		2. Tower radius at z coordinate [m]		

#### Sub command block – turb\_export

With this sub command block, a mann format turbulence box including information from shear, wakes, tower shadow etc. is written. Same data point positions are used as specified in the turbulence module including the parameters specifyed for the originally used mann turbulence box.

Obl.	Command name	Explanation	
*	filename_u	Filename of turbulence box with axial turbulence	
		1. File name	
*	filename_v	Filename of turbulence box with lateral turbulence	
		1. File name	
*	filename_w	Filename of turbulence box with vertical turbulence	
		1. File name	

# Aerodynamics

#### Main command block - aero

This module set up parameters for the aerodynamic specification of the rotor. It is also possible to submit aerodynamic forces to other structures as example the tower or nacelle, but see chapter (Aerodrag) regarding this. The module can be added as many times as requested if multiple aerodynamic rotors are needed.

Obl.	Command name	Explanation
	name	Name o rotor (in case of multiple rotors defined)
*	nblades	Must be the first line in aero commands!
*	hub_vec	<ol> <li>Number of blades</li> <li>Link to main-body vector that points downwind from the rotor under normal conditions. This corresponds to the direction from the pressure side of the rotor towards the suction side where the coordinate system is normally taken from the main shaft system</li> <li>mbdy name or 'old_input' if old_htc_structure format is applied.</li> <li>mbdy coo. component (1=x, 2=y, 3=z). If negative the opposite direction used. Not used together with old_htc_structure input (specify a dummy number).</li> <li>Node number (optional). Node number on mbdy where rotor center is located. 'last' can also be used (default if no value is present).</li> </ol>
*	link	<ul> <li>Linker between structural blades and aerodynamic blades. There must be same number of link commands as nblades! <ol> <li>blade number</li> <li>link chooser – options are</li> <li>mbdy_c2_def (used with new structure format)</li> <li>blade_c2_def (used with old structure format, see description below in this chapter)</li> <li>mbdy name (with new structure format), not used to anything with old structure format.</li> </ol> </li> </ul>
*	ae_filename	1. Filename incl. relative path to file containing aerodynamic layout data (example ./data/hawc2 ae.dat)
*	pc_filename	1. Filename incl. relative path to file containing profile coefficients (example ./data/hawc2_pc.dat)
*	induction_method	<ol> <li>Choice between which induction method that shall be used (0=none, 1=normal BEM dynamic induction, 2= Near Wake induction method)</li> </ol>
*	aerocalc_method	1. Choice between which aerodynamic load calculation method that shall be used. (0=none, 1=normal)
	aerosections	Number of aerodynamic calculation points at a blade. The distribution is performed automatically using a cosinus transformation which gives closest spacing at root and tip. 1. Number of points at each blade.
	aero_distribution	1. Distribution method of aerodynamic

Obl.	Command name	Explanation
	name	Name o rotor (in case of multiple rotors defined)
		<ul> <li>calculation points. Options are:</li> <li>"default" number. The distribution is performed automatically using npoints position with a cosinus transformation which givest closest spacing at root and tip.</li> <li>"ae_file" set. The distribution is given with same spacing as values in the ae_file with set number set</li> </ul>
*	ae_sets	Set number from ae_filename that is linked to blade 1,2,,nblades 1. set for blade number 1 2. set for blade number 2
		nblades. set for blade number nblades
*	tiploss_method	1. Choice between which tip-loss model that shall be used (0=none, 1=prandtl (default))
*	dynstall_method	<ol> <li>Choice between which dynamic stall model that shall be used (0=none, 1=Stig Øye method, 2=MHH Beddoes method, 3=Gaunaa-Andersen method with Deformable Trailing Edge Flap's)</li> </ol>
	3d_correct_method	<ul> <li>Airfoil Cl values from the pc_file is modified for 3D effects.</li> <li>1. Correction method (1=Snel method for correction of Cl values)</li> </ul>
	external_bladedata_dll	<ul> <li>Blade structural data are found in an external encrypted dll. If this command is present the following command lines shall not be present (ae_filename, pc_filename and ae_sets).</li> <li>1. Company name (that has been granted a password, eg. dtu).</li> <li>2. Password for opening this specific dll, eg. test1234</li> <li>3. path and filename for the dll. eg/data/encr blade data.dll</li> </ul>
	output_profile_coef_filename	Interpolated profile coefficients at all aerodynamic calculation points are written into a data file. This command can not be used in combination with encrypted_profile_coef_filename. 1. path and filename for the dll. eg. ./res/aero_profiles.dat

**Sub command block – dynstall\_so** Block that may be included if the Stig Øye dynamic stall method is chosen. If not included defaults parameters are automatically used.

Obl.	Command name	Explanation
	dclda	1. Linear slope coefficient for unseparated flow (default=6.28)
	dcldas	1. Linear slope coefficient for fully separated flow (default=3.14)
	alfs	1. Angle of attack [deg] where profile flow is fully separated. (default=40)
	alrund	1. Factor used to generate synthetic separated flow Cl values (default=40)

taufak	1.	Time	constant	factor	in f	ĩrst	order	filter	for	F
		function	on (def	ault=10	.0).	Inte	ernally	use	d	as
		tau=ta	ufak*cho	ord*vrel						

#### Sub command block – dynstall\_mhh

Block that may be included if the MHH Beddoes dynamic stall method is chosen (see Risø report 1354(en)). If not included defaults parameters are automatically used.

Obl.	Command name	Explanation
	al	<ol> <li>Coefficients of the exponential potential flow step response approximation: Phi(s)=1-A1*exp(-b1*s)- A2*exp(-b2*s). (default= 0.165)</li> </ol>
	a2	<ol> <li>Coefficients of the exponential potential flow step response approximation: Phi(s)=1-A1*exp(-b1*s)- A2*exp(-b2*s). (default= 0.335)</li> </ol>
	b1	<ol> <li>Coefficients of the exponential potential flow step response approximation: Phi(s)=1-A1*exp(-b1*s)- A2*exp(-b2*s). (default= 0.0455)</li> </ol>
	b2	<ol> <li>Coefficients of the exponential potential flow step response approximation: Phi(s)=1-A1*exp(-b1*s)- A2*exp(-b2*s). (default= b2=0.300)</li> </ol>
	update	<ul> <li>Choice between update methods:</li> <li>1. 1 (default)=&gt;update aerodynamics all iterations all timesteps; 0=&gt;only update aerodynamics first iteration each new timestep</li> </ul>
	taupre	1. Non-dimensional time-lag parameters modeling pressure time-lag. Default value =1.5
	taubly	1. Non-dimensional time-lag parameters modeling boundary layer time-lag. Default value=6.0
	only_potential_model	<ol> <li>0(default)=&gt;run full MHH beddoes model; 1=&gt;Potential flow model dynamics superposed to steady force coefficients;</li> </ol>

#### Sub command block – dynstall\_ateflap

This sub-block should be included if the ATEFlap dynamic stall model is chosen (*dynstall\_method* number 3). The dynamic stall model is similar to the MHH model, expanded to account for steady and dynamic effects of trailing edge flap deflections; the model is described in L. Bergami and M. Gaunaa, *ATEFlap Aerodynamic model, a dynamic stall model including the effects of trailing edge flap deflection* (Risoe-R-1792(EN), Risoe DTU, February 2012).

The model requires a .ds input file containing pre-processed steady aerodynamic data for the blade sections containing a flap (see following paragraphs for the file specifications). Sections without any flap are attributed steady input data according to the aerodynamic layout specified in the  $ae_{filename}$ .

Obl.	Command name	Explanation
------	--------------	-------------

Obl.	Command name	Explanation
*	flap	<ul> <li>Mandatory command to define a flap section. The flap is defined on all the blades of the rotor. Command syntax:</li> <li>1. Radius r_start [in m]. Starting point of flap section.</li> <li>2. Radius r_end [in m]. Ending point of flap section (should be &gt; r_start).</li> <li>3. Filename incl. relative path to .ds file containing</li> </ul>
		pre-processed aerodynamic steady input data. See . <i>ds file</i> specifications in the following paragraph. N.B. The location along the blade refer to the 'stretched' blade, distances are given along the half-chord line (as the layout in <i>ae_file</i> ). A maximum of 99 flap sections can be defined.
	ais	<ul> <li>Coefficients for the indicial response exponential function:</li> <li>1. A1 (default= 0.1784)</li> <li>2. A2 (default=0.07549)</li> <li>3. A3 (default=0.3933)</li> <li>Default coefficients describe the step response of a NACA 64-418 profile, where t/c=0.18.</li> </ul>
	bis	Coefficients of the exponential potential flow step response approximation: 1. B1 (default= 0.8000) 2. B2 (default= 0.01815) 3. B3 (default= 0.1390) Default coefficients describe the step response of a NACA 64-418 profile, where t/c=0.18.
	taupre	1. Non-dimensional time-lag parameters modelling pressure time-lag. Default value =1.5
	taubly	1. Non-dimensional time-lag parameters modelling boundary layer time-lag. Default value=6.0
	only_potential_model	<ol> <li>0(default)=&gt;run full ATEFlap model; 1=&gt;Potential flow model dynamics superposed to steady force coefficients;</li> </ol>
	update	Choice between update methods: 1. 1 (default)=>update aerodynamics all iterations all timesteps; 0=>only update aerodynamics first iteration each new timestep
	hystar	1. Camberline coef. (default= -4.675844E-003)
	fylestar	1. Camberline coef. (default=+4.155446E-004)
	fdydxle	1. Camberline coef. (default=+7.236104E-003)
	gdydxle	1. Camberline coef. (default=+3.309147E-003)

The camber line coefficients describe the camber line deformation shape induced by the flap; they are computed according to the thin-airfoil model described in Gaunaa's Wind Energy journal article *Unsteady two-dimensional potential-flow model for thin variable geometry airfoils*. Hystar and fylestar are dimensionless parameters corresponding to the shape integrals Hy and FyLE normalized by the half-chord length. The default coefficients refer to a 10% chord length flap with a continuous deformation shape, describing a circular arc, whose chord forms an angle of 1 degree with the horizontal axis.

#### Sub command block – bemwake\_method

Dynamic inflow settings used to calculate the dynamic induction. If not included defaults parameters are automatically used.

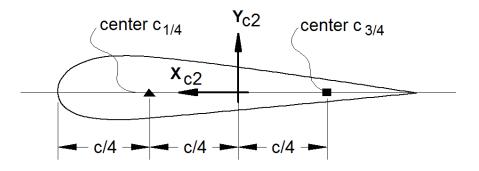

Obl.	Command name	Explanation			
	nazi	<ol> <li>Number of azimuthal points in the induction grid. A high number increased accuracy but slow down the simulation time. Default is 16.</li> </ol>			
	fw	Dynamic time constants and mixing ratio contribution for			

	the far wake part of the induction.
	1. Mixing ratio, default is 0.4
	2. k3 (poly. coef. for r/R sensitivity) default=0.0

a-ct-filename	Filename for a user defined relation bewteen a and ct.

# Data format for the aerodynamic layout

The format of this file which in the old HAWC code was known as the hawc\_ae file is changed slightly for the HAWC2 input format. The position of the aerodynamic center is no longer an input value, since the definition is that the center is located in  $C_{1/4}$  with calculated velocities in  $C_{3/4}$ .

## Position of aerodynamic centers related to c2\_def section coo.

#### Figure 5: Illustration of aerodynamic centers c1/4 and c3/4

Line number	Description			
1	#1: Nset, Number of datasets present in the file. The format of ecah data set can be read below. The datasets are repated without blank lines etc.			
2	#1: Set number. #2: Nrows, Number of data rows for this set			
32+Nrows	Data row according to Table 4			

The format of the file is specified in the following two tables

Table 3: Format of main data structure for the aerodynamic "\_ae" blade layout file

The content of the	colums in a	a data row	is specified in	the table below.

Column	Parameter	
1	r, distance from main_body node 1 along z-coordinate [m]	
2	chord length [m]	
3	thickness ratio between profile height and chord [%]	
4	Profile coefficient set number	

Table 4 Format of the data rows for the aerodynamic "\_ae" blade layout file

# Example of an aerodynamic blade layout file Number of datasets in the file.

1

1 25	Set nr,	nrows.

#### Data format for the profile coefficients file

The format of this file which in the old HAWC code was known as the hawc\_pc file has not been changed for the HAWC2 code.

The format of the file is specified in the following two tables

Line number	Description
1	#1: Nset, Number of datasets present in the file. The format of
	ecah data set can be read below. The datasets are repeated without
	blank lines etc.
2	#1: Nprofiles. Number of profiles included in the data set. There
	must be more than 1 Nprofiles. First profile is the thinnest, last
	profile is the thickest (continously increasing order).
3	#1: Set number. #2: Nrows. #3: Thickness in percent of chord
	length
43+Nrows	Data row according to Table 6

Table 5: Format of main data structure for the profile coefficients file

The content of the	colums in	n a data row	is specified in	table below.
1110 001100110 01 0110	• • • • • • • • • • •			

Column	Parameter
1	$\alpha$ , angle of attack [deg]. Starting with -180.0, ending with +180.0
2	C <sub>1</sub> lift coefficient [-]
3	C <sub>d</sub> drag coefficient [-]
4	C <sub>m</sub> moment coefficient [-]

Table 6 Format of the data rows for the profile coefficients file

#### Data format for the flap steady aerodynamic input (.ds file):

This file contains the pre-processed steady data required by the ATEFlap dynamic stall model. Steady lift, drag and moment coefficients are given as function of angle of attack and flap deflection, together with the fully separated and fully attached lift, and the separation function values required by the Beddoes-Leishmann dynamic stall model.

The input file can be generated automatically through an external pre-processing application, as for instance the "Preprocessor for ATEFlap Dynamic Stall Model, v.2.04". Please refer to the application documentation for further details.

Line number	Description
1	Free for comments
2	Free for comments
3	#1: Aoa0 [rad]. Angle of attack returning a null steady lift
4	Free for comments
5	#1: dCl/dAoa [1/rad]. Gradient of the steady lift function with
	respect to angle of attack variations
6	Free for comments
7	#1: dCl/dBeta [-]. Gradient of the steady lift function with respect
	to flap deflection variations
8	Free for comments
9	#1: Nrows. Total number of the following data-rows.
109+Nrows	Data rows, as specified in following table.

The format of the file is specified in the following two tables:

Table 7: Format of main data structure for the .ds flap steady aerodynamic input file

The content of the columns in a data row is specified in table below.

Column	Parameter
1	$\alpha$ , Angle Of Attack [deg]. Starting with -180.0, ending with +180.0. External
	loop (changes value after going through all the beta flap deflection values, i.e.
	100 rows)
2	Beta, flap deflection. Starting from -49 to +50. Internal loop (changes at every
	data row)
3	C <sub>1</sub> st. Steady lift coefficient [-]
4	C <sub>1</sub> att. Fully attached lift coefficient [-]
5	C <sub>1</sub> fs. Fully separated lift coefficient [-]
6	C <sub>d</sub> drag coefficient [-]
7	C <sub>m</sub> moment coefficient [-]
8	f . Steady value of the separation function [-]

Table 8: Format of the data rows for the .ds flap steady aerodynamic input file

Table 10 Format of the data rows for the profile coefficients file

# Main command block – blade\_c2\_def (for use with old\_htc\_structure format)

In this command block the definition of the centerline of the main\_body is described (position of the half chord). This command shall be used as a main command even though it is only used together with the aerodynamic module. The reason for this is that it used to submit information that is usually given in the new\_htc\_structure format, which is also a main command block. The input data given with the sec commands below is used to define a continuous differentiable line in space using akima spline functions. This centerline is used as basis for local coordinate system definitions for sections along the structure. If a straight line is requested a minimum of three points of this line must be present.

Obl.	Command name	Explanation
*	nsec	Must be the present before a "sec" command.
		1. Number of section commands given below
*	sec	Command that must be repeated "nsec" times
		1. Number
		2. x-pos [m]
		3. y-pos [m]
		4. z-pos [m]
		5. $\theta_z$ [deg]. Angle between local x-axis and
		main_body x-axis in the main_body x-y coordinate
		plane. For a straight blade this angle is the
		aerodynamic twist. Note that the sign is positive
		around the z-axis, which is opposite to traditional
		notation for etc. a pitch angle.

# Aerodrag (for tower and nacelle drag)

#### Main command aerodrag

With this module it is possible to apply aerodynamic drag forces at a given number of structures.

#### Subcommand aerodrag\_element

Command block that can be repeated as many times as needed. In this command block aerodynamic drag calculation points are set up for a given main body.

Obl.	Command name	Explanation	
*	body_name	1. Main_body name to which the hydrodynamic	
	mbdy_name	calculation points are linked.	
*	aerodrag_sections	1. Distribution method: ("uniform" only possibility)	
		2. Number of calculation points (min. 2).	
	nsec	This command must be present before the sec commands	
		1. Number of sections given below	
	sec	This command must be repeated nsec times	
		1. Distance in [m] along the main_body c2_def line.	
		Positive directed from node 1 to node "last".	
		2. C <sub>d</sub> drag coefficient (default=1.0)	
		3. Width of structure (diameter)	
	update_states	Logical parameter that determines whethe the movement of	
		the structure is included or not.	
		1. parameter (1=states are updated (default), 0=not	
		updated)	

\*) Input commands that must be present

# Hydrodynamics

### Main command block - hydro

In this command block hydrodynamic forces calculated using Morison's formula is set up.

Obl.	Command name	Explanation
*	gravity	1. Gravity acceleration (used for calculation of buoyancy forces). Default = $9.81 \text{ m/s}^2$
*	mudlevel	1. Mud level [m] in global z coordinates.
*	mwl	1. Mean water level [m] in global z coordinates.
*	rho	1. Density of the water $[kg/m^3]$ . Default=1027
	wave_direction	<ol> <li>Wave direction [deg]. Direction is positive when the waves come forward from the right when looking towards the wind at default conditions.</li> <li>V<sub>0</sub> Wave direction</li> </ol>
	current	1. Current type (0=none (default), 1=constant, 2=power law U(z)=U0((z+mudlevel- mwl)/(mudlevel-mwl))^alfa
		2. Current velocity at mwl, u0
		3. type parameter. If type=2 then parameter is alfa
		<ol> <li>Current direction relative to wave direction [deg]. Positive direction if current comes from the right</li> </ol>
		looking towards the incoming waves.
	water_kinematics_dll	1. Filename incl. relative path to file containing water
		kinematics dll (example ./hydro/water_kin.dll)
		2. String sent to initialization of dll. This is typical the name of a local inputfile of the dll.

#### Sub command block – water\_properties

#### Sub command block – hydro\_element

Command block that can be repeated as many times as needed. This command block set up hydrodynamic calculation points and link them to a main\_body.

Obl.	Command name	Explanation
*	body_name mbdy_name	1. Main_body name to which the hydrodynamic calculation points are linked.
*	hydrosections	<ol> <li>Distribution method of hydrodynamic calculation points. Options are:         <ul> <li>"uniform" nnodes. Where uniform ensures equal distance of the calculation points. nnodes are number of calculation points.</li> <li>"auto" nint. Here calculations points are chosen as the postions of the structural nodes and the hydro dynamic input section given by the sec command. The parameter <i>nint</i> is a refinement parameter given <i>nint</i> extra calculation points in between the other points.</li> </ul> </li> </ol>

Obl.	Command name	Explanation		
*	nsec	This command must be present before the sec commands		
		1. Number of sections given below		
*	sec	This command must be repeated nsec times		
		1. Relative distance along the main body c2 def		
		line. Positive directed from node 1 to node "last".		
		2. $C_m$ inertia coefficient (default=1.0)		
		3. $C_d$ drag coefficient (default=1.0)		
		4. Cross sectional area $[m^2]$		
		5. Cross sectional area to which $C_m$ is related.		
		(default=area for circular sections) $[m^2]$		
		6. Width of construction perpendicular to flow		
		direction [m]		
		7. drdz gradient(optional). For calculating the		
		buoyancy also for conical sections the gradient		
		expressing the change in radius with change of		
		distance along the main_body c2_def line. Only		
		important when buoyancy forces are included.		
		8. Axial drag $C_d$ coefficient for concentrated force		
		contribution (optional). Drag area is circular area		
		defined by the local width. Contribution is		
		quadratic regarding water velocity.		
		9. Axial inertia $C_m$ coefficient for concentrated force		
		contribution (optional). Inertia volume is a sphere		
		defined by the local width as diameter.		
		10. Axial drag $C_d$ coefficient for concentrated force		
		contribution (optional). Drag area is circular area		
		defined by the local width. Contribution is linear		
		regarding water velocity.		
		11. Internal cross sectional area for flooded members		
		$[m^2]$ (optional). 0=member is not flooded.		
		12. Torque friction coefficient $C_f$ (optional). For		
		rotating cylinders around local z-direction.		
		1		
		$M_z = \frac{1}{16} \rho D^4 \omega^2 C_f$		
	1	10		
	buoyancy	1. Specification whether buoyancy forces are		
		included or not. 0=off (default), 1=on (remember		
		to define the 7 <sup>th</sup> parameter in the <i>sec</i> input line.		
	update_states	1. Specification whether the hydrodynamic sections		
		are updated in time with respect to pos, vel, acc		
		and orientations, or simply considered to remain		
		fixed. 0=not updated, 1=updated (default)		
	update_kinematics	1. Specification whether the water kinematics are		
		updated during iterations or only once per time		
		step. 0=only updated once per time step, 1=full		
		update (default).		

Here is an example of this written into the htc-input file.

```
begin HYDRO_ELEMENT ;
mbdy_name cylinder ;
buoyancy l ;
update_states l ; (0: no dynamic interaction, 1: fully coupled solution
hydrosections auto 4 ; dist, of hydro calculation points from 1 to nsec
nsec 2; z Cm Cd A Aref width dr/dz Cd_a_(quad) Cm_a Cd_a_lin Aif
sec 0.0 l 1 1 3.404 3.404 2.082 0.0 0.0 0.0 0.0 3.023;
sec 5.0 l 1 3.404 3.404 2.082 0.0 0.0 0.0 3.023;
end HYDRO_ELEMENT ;
```

This example shows a flooded cylindrical element (l=5 m, d=2,082 m and t=60 mm).

#### Description of the water\_kinematics\_dll format.

```

end subroutine get\_kinematics

#### User manual to the standard wkin.dll version 1.9.

The wkin.dll which is delivered along with the HAWC2 code needs a separate inputfile. The format for these inputs are the same as the HAWC2 main inputfile with usage of begin..end clauses, semi colon separators, exit command etc. Command words are described below.

All command words written below has to be included in an begin .. end clause called wkin\_input:

begin wkin\_input;

end wkin\_input; exit;

#### Version info:

1-0	TJUL	Basic edition by TJUL
1-1	ANMH	Wave field can be read by file and used directly through fft
		conversion
1-2	TJUL	Directional spreading included
1-3	ANMH	Bug corrected regarding read on seed number using iregular
		waves
1-4	TJUL	Pierson-Moscowitz spectrum added as option
		Stream function wave added
		Possible pre processing of wave field to speed up simulation
		time and enable many more coefficients
1-5	TJUL	Bug in stream function wave. Static pressure was included –
		now removed
1-6	TJUL	Bug in stream fuction wave. lateral position was applied
		instead of vertical in kinematics look-up!!!

1-7	TKIM	New wave format for precalculated (high order) wave fields
1-8	ANMH	Update in deterministic iregular waves+bugfix
1-9	TJUL	New option for white noise wave exitation
2-0	TJUL	Bug fix of version 1-9. Version 1-9 had some debug
		statements included that could meas up the time.

#### Main commands in the wkin.dll:

Obl.	Command name	Explanation		
*	wavetype	1. Type of wave used. (0=regular airy, 1=irregular airy, 2=deterministic irregular airy, 3=regular stream function, 4=general wavemode format)		
*	wdepth	1. Water depth [m]. Positive value.		

#### Sub command *reg\_airy*:

Command that need to be present if the wavetype equals 0 in the main command.

Obl.	Command name	Explanation		
*	stretching	1. Wheeler stretching of waves. (0=off, 1=on)		
*	wave	1. Significant wave height H <sub>s</sub> [m]		
		2. Wave period T [s]		

#### Sub command *ireg\_airy*:

Command that need to be present if the wavetype equals 1 in the main command.

Obl.	Command name	Explanation			
*	stretching	1. Wheeler stretching of waves. (0=off, 1=on)			
*	spectrum	1. Base spectrum used. (1=jonswap, 2= Pierson			
		Moscowitz)			
	jonswap	Jonswap spectrum formulation			
		1. Significant wave height H <sub>s</sub> [m]			
		2. Wave period $T_p[s]$			
		3. γ parameter [-]. A typical value is 3.3			
	pm	Pierson-Moscowitz spectrum			
		1. Significant wave height H <sub>s</sub> [m]			
		2. Wave period T <sub>p</sub> [s]			
	wn	White noise.			
		1. Target variance level [m <sup>2</sup>			
		2. $f_0$ , minimum frequency			
		3. f <sub>1</sub> , maximumn frequency			
*	coef	1. Number of coefficients. Normally 200 are used			
		even though higher values are recommended in			
		general. A speed issue			
		2. Seed number. A positive integer value.			
	spreading	1. Spreading model. (0=none, $1=K_{2s}$ model also			
		referred to as $K_n$ model)			
		2. Spreading parameter. If model=1 the parameter is			
		s, a positive integer. The higher value, the less			
		spreading.			
	pregen	Pre-generation of a wave field (default is on). Using this			
		option the irregular wave field is calculated during			
		initialization phase and only table look-up is done during			
		the time simulation phase. Very fast and still accurate.			
		1. Pregen option. (0=traditional approach (slow),			
		1=pregenerated wave field used (default))			

#### Sub command *det\_airy*:

Command that need to be present if the wavetype equals 2 in the main command. This command is used when water kinematics needs to be calculated based on a measured elevation time series.

Obl.	Command name	Explanation	
*	file	1. File name for measured wave elevation.	
*	nsamples	1. Number of lines present in wave elevation file	
*	nskip	1. Number of lines to skip before reading of wave elevation file	
*	columns	<ol> <li>Colum number for time sensor in file.</li> <li>Colum number for wave elevation in file.</li> </ol>	
	stretching	1. Wheeler stretching of waves. (0=off, 1=on (default))	
	cutoff_frac	1. Fraction of total energy which is discarded in the low and high frequency ranges. Default 1E-5	

#### Sub command *strf*:

Command that need to be present if the wavetype equals 3 in the main command. This command is used when water kinematics needs to be calculated based on a measured elevation time series.

Obl.	Command name	Explanation		
*	file	1. File name for measured wave elevation.		
*	nsamples	1. Number of lines present in wave elevation file		
*	nskip	1. Number of lines to skip before reading of wave elevation file		
*	colums	<ol> <li>Colum number for time sensor in file.</li> <li>Colum number for wave elevation in file.</li> </ol>		
	stretching	1. Wheeler stretching of waves. (0=off, 1=on (default))		
	cutoff_frac	1. Fraction of total energy which is discarded in the low and high frequency ranges. Default 1E-5		

#### Sub command wavemods:

Command that need to be present if the wavetype equals 3 in the main command. This command is used when water kinematics needs to be calculated based on a measured elevation time series.

Obl.	Command name	Explanation
*	filename_y	
*	filename_z	
*	ncol	
*		

Example of an input file with wave kinematics data for the wavemods option.

# Soil module

### Main command block - soil

In this command block soil spring/damper forces can be attached to a main body. The formulation is performed so it can be used for other external distributed spring/damper systems than soil.

#### Sub command block – soil\_element

Command block that can be repeated as many times as needed. In this command block the distributed soil spring/damper system is set up for a given main body.

Obl.	Command name	Explana	tion
*	body_name	1. Main_body name to which the soil calculation	
			points are linked.
*	datafile	1.	Filename incl. relative path to file containing soil
			spring properties (example ./soil/soildata.dat)
*	soilsections	1.	Distribution method: ("uniform" only possibility)
		2.	Number of section (min. 2).
	damping_k_factor	1.	Rayleigh kind of damping. Factor the linear
			stiffness coefficients are multiplied with to obtain
			the damping coefficients. When the factor is 1.0
			the vibration is critically damped for the rigid
			mainbody connected to the spring and dampers.
*	set	1.	Set number in datafile that is used.

\*) Input commands that must be present

\*) Command can be repeated as many times as desired.

#### Data format of the soil spring datafile

In the file (which is a text file) different distributed springs can be defined. Each set is located after the "#" sign followed by the set number. Within a set the following data needs to be present.

line 1	"spring type"	(can be "axial", "lateral" or "rotation_z")
line 2:	"nrow ndefl"	(nrow is number of rows, ndefl is number of deflections (colums)
line 33+nrow	"z_global F(1) F(2),, F(ndefl)"	First colum is the spring location (global z coordinate). The following colums are Force/length at the different deflection stations. First deflection must be zero. The forces are assumed symmetrical around the zero deflection.

## An example is given below:

This is a nonlinear soil spring demonstration file					
#1					
lateral (axial/lateral)					)
54			nrow n		
			0.2		x1 x2 x3 [m]
0.0	0	15	20		Z_G F_1 F_2 F_3 F_ndefl [kN/m]
10.0	0	15	20	500	
20.0	0	15	20	500	
30.0	0	15	20	500	
40.0	0	15	20	500	
#2					
axial			(axial/	lateral	)
54			nrow n	defl	
	0.0	0.1	0.2	1.0	x1 x2 x3 [m]
0.0	0	150	200	5000	Z_G F_1 F_2 F_3 F_ndefl [kN/m]
10.0	0	150	200	5000	
20.0	0	150	200	5000	
30.0	0	150	200	5000	
40.0	0	150	200	5000	
#3					
rotati	on_z		(axial/	lateral	/rotation_z)
54			nrow n	defl	
	0.0	0.1	0.2	1.0	x1 x2 x3 [rad]
0.0	0	150	200	5000	ZGM1M2M3Mndefl[kNm/m]
10.0	0	150	200	5000	
20.0	0	150	200	5000	
30.0	0	150	200	5000	
40.0	0	150	200	5000	
		200	200	2000	

# **External forces through DLL**

#### Main command block – Force

### Sub command - DLL

This command block can be used when a user defined external force is applied to the structure. The main difference between this DLL format and the normal DLL control interface (used with external controllers) is that added stiffness is calculated initially leading to a more robust a fast solution of the coupled system. This force module can with good results be applied for external equivalent soil-springs or hydrodynamic forces for floating constructions or mooring lines.

Obl.	Command name	Explanation and parameters
	dll	1. Filename incl. relative path to the external DLL (example ./dll/force.dll)
	update	1. Name of subroutine in the DLL.
	mbdy	<ol> <li>Name of main body to which force dll is coupled.</li> </ol>
	node	1. Node number of main body to which force dll is couple

```
Example of a DLL interface written in fortran90

```

# Output

This command **output** can either be a main command block or a sub command block within the hawc\_dll command block. In the tables below two special columns are introduced. One is *only option* and the other *label option*. When the check mark is 'yes' in *only option* it is possible to use only one of the fields if mre than one sensor was defined through the command. The sensor that is used is determined by the number following the *only* command word, see example below.

```
constraint bearing1 shaft_rot 2 only 2;
```

If the *only* command (and the following number) was omitted two sensors was defined; one for the angle and one for the velocity. With the *only* command only the velocity sensor is used in the output since the following number is 2.

With the label option it is possible to make a user defined label of the sensor which is written in the sensor list file. The label command is the # symbol. Everything after the # symbol is used as a label. An example of this could be

```
dll inpvec 1 1 # This is a dummy label ;
```

#### Commands used with results file writing

When the output command is used for output files (the most normal purpose) some information regarding file name and format needs to be give

Obl	Command	Explanation
*	filename	1. Filename incl. relative path to outputfile without extension
		(example ./res/output)
	data_format	ASCII or compressed binary output can be chosen. Default is the
		ASCII format if nothing is specified.
		1. format ('hawc_ascii'=ASCII format,
		'hawc_binary'=compressed binary format,
		'flex_int'=compressed binary format)
	buffer	Buffer size in terms of time steps. When the buffer is full the data are written to data file. Only used together with the ASCII format.
	time	Time start $t_0$ and stop $t_1$ for output is defined. Default is the entire simulation length if nothing is specified. 1. $t_0$ 2. $t_1$

#### File format of HAWC\_ASCII files

Results are written to an ascii formatted data file with the name assigned to the filename variable (eg. filename ./res/resfil ). The data file will have the extension .dat as a standard. The description of the sensors in the data file is given in another textfile with same filename as the data file but the extension .sel. An example could be: ./res/resfil.dat and ./res/resfil.sel.

In the .sel-file, line numer 9 specifies the following parameters: Number of scans, Number of sensors, Duration of output file, Data format (ASCII/BINARY). Example:

10 96 20.000 ASCII

From line number 13 and onwards, the sensors are specified with the following information:

Sensor number, Variable description, unit, Long description. Example:

5 beal angle\_speed rad/s pitchl angle speed

Full example of the .sel file:

Version	ID : HAWC2MB	4.3w		
				Time : 14:23:28
				Date : 22:11.2006
Result f	ile : ./res2	_rev0/case41c_r	ohydro.dat	
Scans	Channels	Time [sec]	Format	
4500	199	90.000	ASCII	
Channel	Variable D	escription		
1	Time		S	Time
2	beal angle		deg	shaft_rot angle
3	beal angle	_speed	rpm	shaft_rot angle speed
4	beal angle		deg	pitchl angle
5	beal angle	_speed	rad/s	pitchl angle speed
б	beal angle		deg	pitch2 angle
7	beal angle	_speed	rad/s	pitch2 angle speed
8	beal angle		deg	pitch3 angle
9	beal angle	_speed	rad/s	pitch3 angle speed

#### File format of HAWC\_BINARY files

In this file format results are written to a binary unformatted data file with the name assigned to the filename variable (eg. filename ./res/resfil ). The data file will have the extension .dat as a standard. The description of the sensors in the data file is given in another textfile with same filename as the data file but the extension .sel. An example could be: ./res/resfil.dat and ./res/resfil.sel.

The data are scaled to standard 2-byte integers, with a range of 32000 using a scalefactor. The scalefactor is determined for each output sensor

$$s = \frac{MAX(abs(max), abs(min))}{32000}$$

where *max* and *min* are the largest and lowest number in the original data for the sensor. These scale factors are written in the end of the accompanying .sel file. When

converting a binary number to the actual number its just a matter of multiplying the binary numbers of a sensor with the corresponding scalefactor.

In the accompanying text file, which has the extension .sel-file, information of the content in the datafile is stored. In line number 9 the following parameters are specified: Number of scans, Number of sensors, Duration of output file, Data format (ASCII/BINARY). Example:

10 96 20.000 ASCII

From line number 13 and onwards, the sensors are specified with the following information:

Sensor number, Variable description, unit, Long description. Example:

```
5 beal angle_speed rad/s pitchl angle speed
```

From line number 9+nsensors+5 and upwards the scalefactors are written.

Full example of the .sel file:

Version 3	ID : HAWC2MB	4.3		
				Time : 14:23:28
				Date : 22:11.2006
Result f:	ile : ./res2	_rev0/case41c_r	ohydro.dat	
Scans	Channels	Time [sec]	Format	
4500	9	90.000	ASCII	
Channel	Variable D	escription		
1	Time		s	Time
2	beal angle		deg	shaft_rot angle
3	beal angle	_speed	rpm	shaft_rot angle speed
4	beal angle	1	deg	pitch1 angle
5	beal angle	_speed	rad/s	pitchl angle speed
б	beal angle	1	deg	pitch2 angle
7	beal angle	_speed	rad/s	pitch2 angle speed
8	beal angle		deg	pitch3 angle
9	beal angle	speed	rad/s	pitch3 angle speed

Scale factors: 1.56250E-04 5.61731E-03 4.41991E-04 1.00000E+00

- 1.00000E+00 1.00000E+00
- 1.00000E+00
- 1.00000E+00
- 1.00000E+00

An important thing to notice is that in the binary data file all sensors are stored sequentially, i.e. all data for sensor 1, all data for sensor 2, etc. This way of storing the data makes later reading of a sensor extra fast since all data for a sensor can be read without reading any data for the other sensor.

A small matlab code for reading the binary HAWC2 format can be seen below.

```
function sig = ReadHawc2Bin(FileName,path);
% Reads binary HAWC2 results file
°
% [t,sig] = ReadFlex4(FileName,Ch);
% filename should be without extension
Ŷ
                 _____
% BSKA 26/2-2008
ThisPath = pwd; cd(path(1,:))
% reading scale factors from *.sel file
fid = fopen([FileName,'.sel'], 'r'); fgets(fid); fgets(fid);
fgets(fid); fgets(fid); fgets(fid); fgets(fid);
fgets(fid);
tline = fscanf(fid,'%d');
N = tline(1); Nch = tline(2); Time = tline(3); fclose(fid);
ScaleFactor = dlmread([FileName,'.sel'],'',[9+Nch+5 0 9+2*Nch+4
0]);
% reading binary data file
fid = fopen([FileName,'.dat'], 'r'); sig =
fread(fid,[N,Nch],'int16')*diag(ScaleFactor); fclose(fid);
cd(ThisPath)
```

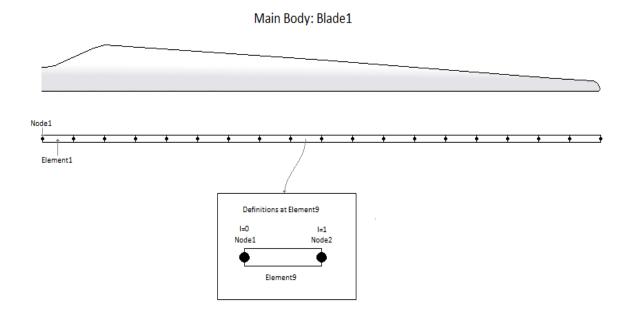

# mbdy (main body output commands)

Command 1	Command 2	Explanation	Only	Label
			option	option
mbdy	forcevec	<ul> <li>F<sub>x</sub>, F<sub>y</sub>, F<sub>z</sub> shear force vector defined to output.</li> <li>1. Main_body name</li> <li>2. Element number</li> <li>3. Node number on element</li> <li>4. Main_body name of which coordinate system is used for output.</li> <li>"global" and "local" can also be used. Local is around local beam main bending directions.</li> </ul>	yes	yes
mbdy	momentvec	<ul> <li>M<sub>x</sub>, M<sub>y</sub>, M<sub>z</sub> moment vector defined to output.</li> <li>1. Main_body name</li> <li>2. Element number</li> <li>3. Node number on element</li> <li>4. Main_body name of which coordinate system is used for output.</li> <li>"global" and "local" can also be used. Local is around local beam main bending directions.</li> </ul>	yes	yes

Command 1	Command 2	Explanation	Only option	Label option
mbdy	state	<ul> <li>Vector with 3 components of either position, velocity or acceleration of a point on an element defined to output. If 'acg' is used, the acceleration including the gravity contribution is written. <ol> <li>State: 'pos', 'vel', 'acc', 'acg'</li> <li>("pos"=position, "vel"=velocity, "acc"=acceleration)</li> <li>Main_body name</li> <li>Element number</li> <li>Relative distance from node 1 to node 2 on element</li> <li>Main_body name of which coordinate system is used for output. "global" can also be used.</li> </ol> </li> </ul>	yes	yes
mbdy	state_at	Vector with 3 components of either position, velocity or acceleration of a point on an element defined to output. The point is offset from the element z axis by an x and y distance in element coordinates.         1. State: 'pos', 'vel' or 'acc'         2. Main_body name         3. Element number         4. Relative distance from node 1 to node 2 on element         5. Main_body name of which coordinate system is used for output. "global" can also be used.         6. x-coordinate offset [m]         7. y-coordinate offset [m]	yes	Yes
mbdy	state_at2	<ul> <li>Vector with 3 components of either position, velocity or acceleration of a point on an element defined to output. The point is offset from the c2_def centerline z axis by an x and y distance in local c2def centerline coordinates. <ol> <li>State: 'pos', 'vel' or 'acc'</li> <li>Main_body name</li> <li>Element number</li> <li>Relative distance from node 1 to node 2 on element</li> <li>Main_body name of which coordinate system is used for output. "global" can also be used.</li> <li>x-coordinate offset [m]</li> <li>y-coordinate offset [m]</li> </ol> </li> </ul>	yes	Yes

Command 1	Command 2	Explanation	Only	Label
			option	option
mbdy	state_rot	Vector with components of either axis and angle (angle [rad], $r_1, r_2, r_3$ ), euler parameters (quaternions $r_0, r_1, r_2, r_3$ ), euler angles, rotation velocity ( $\omega$ -vector) or rotation acceleration ( $\dot{\omega}$ -vector) of a point on an element defined to output. For the sensor eulerang_xyx a set of euler angles are created based on the orientation matrix. Be aware that the method used is only valid for rotations in the intervals	yes	Yes
		$(\theta_x \pm 180^\circ, \theta_y \pm 90^\circ, \theta_x \pm 180^\circ)$ . The method proj_ang can be used to see how much a blade tip rotates around the pitch axis, but be aware that the angles are how the element is oriented and not necesarily how the local chord is rotated. With the command proj_ang the angles are obtained from the local element orientation 3x3 matrix T <sub>e</sub> , seen from the chosen coordinate system using the Atan2 functions (rot_x=atan2[T <sub>e</sub> (2,3), T <sub>e</sub> (3,3)], rot_y=atan2[T <sub>e</sub> (1,2), T <sub>e</sub> (2,2)]). 1. State : 'axisangle', 'eulerp', 'eulerang_xyz', 'omega', 'omegadot' or proj_ang 2. Main_body name 3. Element number 4. Relative distance from node 1 to node 2 on element		
		<ol> <li>Main_body name of which coordinate system is used for output. "global" can also be used.</li> </ol>		

This illustration shows how the sensors are placed on an element in terms of local nodes and relative distance.

## Constraint (constraint output commands)

## bearing1

South gr				
Command 1	Command 2	Explanation	Only	Label
			option	option
constraint	bearing1	<ul> <li>Bearing angle and angle velocity defined to output</li> <li>bearing1 name</li> <li>unit of output</li> <li>(1:angle [unit=rad, range -π:π], vel [rad/s];</li> <li>2:angle [unit=deg, range 0:360], vel [rpm];</li> <li>3:angle [unit=deg, range 0:360], vel [rad/s]);</li> <li>4:angle [unit=deg, range -180:180], vel [rad/s];</li> <li>5:angle [unit=deg, range -180:180], vel [deg/s])</li> </ul>	Yes	No

### bearing2

bearing				
Command 1	Command 2	Explanation	Only option	Label option
constraint	bearing2	<ul> <li>Bearing angle and angle velocity defined to output</li> <li>1. bearing1 name</li> <li>2. unit of output</li> <li>(1:angle [unit=rad, range -π:π], vel [rad/s];</li> <li>2:angle [unit=deg, range 0:360], vel [rpm];</li> <li>3:angle [unit=deg, range 0:360], vel [rad/s]);</li> <li>4:angle [unit=deg, range -180:180], vel [rad/s];</li> <li>5:angle [unit=deg, range -180:180], vel [deg/s])</li> </ul>	Yes	No

## bearing3

Command 1	Command 2	Explanation	Only option	Label option
constraint	bearing3	Bearing angle and angle velocity defined to output 1. bearing1 name 2. unit of output (1:angle [unit=rad, range -π:π], vel [rad/s]; 2:angle [unit=deg, range 0:360], vel [rpm]; 3:angle [unit=deg, range 0:360], vel [rad/s]); 4:angle [unit=deg, range -180:180], vel [rad/s]; 5:angle [unit=deg, range -180:180], vel [deg/s])	Yes	No

**bearing4** Rotation angle and velocity of the two axis perpendicular to the cardan shaft torsion axis are outputted.

Command 1	Command 2	Explanation	Only option	Label option
constraint	bearing4	<ul> <li>Bearing angle and angle velocity defined to output</li> <li>bearing1 name</li> <li>unit of output <ul> <li>(1:angle [unit=rad, range -π:π], vel [rad/s];</li> <li>2:angle [unit=deg, range 0:360], vel [rpm];</li> <li>3:angle [unit=deg, range 0:360], vel [rad/s]);</li> <li>4:angle [unit=deg, range -180:180], vel [rad/s];</li> <li>5:angle [unit=deg, range -180:180], vel [deg/s])</li> </ul> </li> </ul>	Yes	No

**body (old body output commands)** These commands are still part of the code but should be seen as obsolete since they refer to an internal body naming insted of the main\_body names. Please refer to the *mbdy* output commands.

Command 1	Command 2	Explanation	Label option
body	forcevec	$F_x$ , $F_y$ , $F_z$ shear force vector defined to output. Unit [kN]	No
		1. body number	
		2. Element number	
		3. Node number on element	
		4. coordinate system (1=body,	
		2=global, 3=element)	
body	momentvec	$M_x$ , $M_y$ , $M_z$ moment vector defined to	No
		output. Unit [kNm]	
		1. body number	
		2. Element number	
		3. Node number on element	
		4. coordinate system (1=body,	
		2=global, 3=element)	
body	node_defl	x,y,z deflection vector (within a body)	No
		defined to output. Unit [m]	
		1. body number	
		2. Element number	
		3. Node number on element	
		4. coordinate system (1=body,	
1		2=global, 3=element)	N.
body	node_rot	$\theta_x, \theta_y, \theta_z$ , rotations (within a body) define	No
		to output. Unit [rad]	
		1. body number	
		2. Element number	
		3. Node number on element	
		4. coordinate system (1=body, 2=global, 3=element)	
body	pitchangle	Pitchangle of pitch bearing defined with	No
oody	pronungie	the old htc structure is defined to output.	110
		1. Unit (1=[rad], 2=[deg]	
		2. Pitch bearing number	
body	pitchspeed	Pitch velocity of pitch bearing defined	No
	r ··· ·r ···	with the old htc structure is defined to	
		output.	
		1. Unit $(1=[rad/s], 2=[deg/s]$	
		2. Pitch bearing number	
body	node_state	State vector (position, velocity or	No
-		accelertion) of a given on an element is	
		defined to output.	
		1. state ("pos"=position,	
		"vel"=velocity,	
		"acc"=acceleration)	
		2. body name	
		3. element number	
		4. $z_{rel}$ (distance between node 1 and	
		2 divided by element length)	
		5. coordinate system (1=global)	

## aero (aerodynamic related commands)

Command 1	Command 2	Explanation	Label option
aero	time	Simulation time to output. No parameters.	No
aero	azimuth	Azimuth angle of selected blade. Zero is	No
		vertical downwards. Positive clockwise	
		around blade root y-axis. Unit [deg]	
		1. Blade number	
aero	omega	Rotational speed of rotor. Unit [rad/s]	No
aero	vrel	Relative velocity in x-y local aerodynamic	No
		plane. Unit [m/s]	
		1. Blade number	
		2. Radius [m] (nearest inner	
		calculation point is used)	
aero	alfa	Angle of attack in x-y local aerodynamic	No
		plane. Unit [deg]	
		1. Blade number	
		2. Radius [m] (nearest inner	
		calculation point is used)	
aero	alfadot	Pitch rate term (z-axis rotation) in local	No
		aerodynamic plane, as used for non-	
		circulatory contributions. Unit [rad/s]	
		1. Blade number	
		2. Radius [m] (nearest inner	
		calculation point is used)	
aero	sideslip	Side slip angle (from radial flow of BEM	No
uero	sidestip	expansion)	110
		1. Blade number	
		2. Radius [m] (nearest inner	
		calculation point is used)	
aero	beta	Flap deflection angle (matching the	No
delo	beta	deflection specified by the flap control .dll):	110
		1. Blade number	
		2. Flap number, according to the order	
		defined in the dynstall_ateflap sub-	
		command block.	
aero	cl	Instantaneous lift coefficient. Unit [-]	No
ació	C1	1. Blade number	110
		2. Radius [m] (nearest inner	
		calculation point is used)	
aero	cd	Instantaneous drag coefficient. Unit [-]	No
acto	cu	1. Blade number	110
		2. Radius [m] (nearest inner	
		calculation point is used)	
aero	cm	Instantaneous moment coefficient. Unit [-]	No
acto	CIII	1. Blade number	110
		2. Radius [m] (nearest inner	
		calculation point is used)	
aero	lift	Lift force at calculation point. Unit [kN/m]	No
aero	1111	1. Blade number	INU
0.070	drag	calculation point is used)	Na
aero	drag	Drag force at calculation point. Unit [kN/m]	No
		1. Blade number	
		2. Radius [m] (nearest inner	
		calculation point is used)	

Command 1	Command 2	Explanation	Label option
aero	moment	Aerodynamic moment at calculation point.         Unit [kNm/m]         1. Blade number         2. Radius [m] (nearest inner calculation point is used)	No
aero	secforce	Aerodynamic force at calculation point.Local aero coo. Unit [kN/m]1. Blade number2. Dof number (1=Fx, 2=Fy, 3=Fz)3. Radius [m] (nearest inner calculation point is used)	No
aero	secmoment	<ul> <li>Aerodynamic moment at calculation point.</li> <li>Local aero coo. Unit [kN/m]</li> <li>1. Blade number</li> <li>2. Dof number (1=M<sub>x</sub>, 2=M<sub>y</sub>, 3=M<sub>z</sub>)</li> <li>3. Radius [m] (nearest inner calculation point is used)</li> </ul>	No
aero	int_force	<ul> <li>Integrated aerodynamic forces from tip to calculational point. NB the integration is performed around the C<sub>3/4</sub> location. Unit [kN]</li> <li>1. Coordinates system (1=local aero coo, 2=blade ref. system, 3=global, 4=rotor polar)</li> <li>2. Blade number</li> <li>3. Dof number (1=M<sub>x</sub>, 2=M<sub>y</sub>, 3=M<sub>z</sub>)</li> <li>4. Radius [m] (nearest inner calculation point is used)</li> </ul>	No
aero	int_moment	<ul> <li>Integrated aerodynamic moment from tip to calculational point. NB the integration is performed around the C<sub>3/4</sub> location. Unit [kN]</li> <li>1. Coordinates system (1=local aero coo, 2=blade ref. system, 3=global, 4=rotor polar)</li> <li>2. Blade number</li> <li>3. Dof number (1=M<sub>x</sub>, 2=M<sub>y</sub>, 3=M<sub>z</sub>)</li> <li>4. Radius [m] (nearest inner calculation point is used)</li> </ul>	No
aero	torque	Integrated aerodynamic forces of all blades to rotor torsion. Unit [kNm]. No parameters	No
aero	thrust	Integrated aerodynamic forces of all blades to rotor thrust. Unit [kN]. No parameters	No
aero	position	<ul> <li>Position of calculation point. Unit [m].</li> <li>Please be aware that if the blade ref system is used, the orientation is in the blade coo, but the origo is still in the hub center.</li> <li>1. Coordinates system (1=local aero coo, 2=blade ref. system, 3=global, 4=rotor polar)</li> <li>2. Blade number</li> <li>3. Dof number (1=M<sub>x</sub>, 2=M<sub>y</sub>, 3=M<sub>z</sub>)</li> <li>4. Radius [m] (nearest inner calculation point is used)</li> </ul>	No

Command 1	Command 2	Explanation	Label option
aero	rotation	Orientation of calculation point. Unit [deg].	No
		1. Blade number	
		2. Dof number $(1=\theta_x, 2=\theta_y, 3=\theta_z)$	
		3. Radius [m] (nearest inner	
		calculation point is used)	
		4. Coordinates system (1=blade_ref.	
		coo, 2=rotor polar coo.)	
aero	velocity	Velocity of calculation point. Unit [m/s].	No
		1. Coordinates system (1=local aero	
		coo, 2=blade ref. system, 3=global,	
		4=rotor polar)	
		2. Blade number	
		3. Dof number $(1 = V_x, 2 = V_y, 3 = V_z)$	
		4. Radius [m] (nearest inner	
		calculation point is used)	
aero	acceleration	Acceleration of calculation point. Unit	No
		$[m/s^2]$ .	
		1. Coordinates system (1=local aero	
		coo, 2=blade ref. system, 3=global,	
		4=rotor polar)	
		2. Blade number 2. Def number $(1 - Y - 2 - Y - 2 - Y)$	
		3. Dof number $(1 = V_x, 2 = V_y, 3 = V_z)$	
		4. Radius [m] (nearest inner	
0.070	tors	calculation point is used) Aeroelastic torsional twist minus initial	No
aero	tors_e	static twist of a blade section.	INO
		1. Blade number	
		2. Radius [m] (nearest inner	
		calculation point is used)	
aero	windspeed	Free wind speed seen from the blade. Unit	No
uero	windspeed	[m/s]	110
		1. Coordinates system (1=local aero	
		coo, 2=blade ref. system, 3=global,	
		4=rotor polar)	
		2. Blade number	
		3. Dof number $(1 = V_x, 2 = V_y, 3 = V_z)$	
		4. Radius [m] (nearest inner	
		calculation point is used)	
aero	spinner_lidar	Sensor emulating a spinner mounted lidar	No
		1. Measurement type (1=single point,	
		3=volume average)	
		2. Scan type (1=circular scan,	
		2=horizontal line (sine sweep),	
		3=horizontal line (linear sweep),	
		4=circular 2D scan)	
		3. Focus length [m]	
		4. Measurement angle [deg]	
		5. Scanning velocity [rev/sec]	
		<ul><li>6. Velocity fraction (2D scan)</li><li>7. Aperture radius (volume) [m]</li></ul>	
		8. Number of points in volume scan	
		9. Wavelength (Volumen) [m]	
		9. wavelengui (volumen) [m]	l

Command 1	Command 2	Explanation	Label option
aero	induc	Local induced velocity at calculation point.	No
		Unit [m/s]	
		1. Coordinates system (1=local aero coo, 2=blade ref. system, 3=global,	
		4=rotor polar)	
		2. Blade number	
		3. Dof number $(1 = V_x, 2 = V_y, 3 = V_z)$	
		4. Radius [m] (nearest inner	
		calculation point is used)	N
aero	induc_sector_ct	Thrust coefficient at a position on the rotor. Unit [-]	No
		1. Radius [m/s]	
		2. Azimuth angle (zero downwards)	
		[deg]	
aero	induc_sector_cq	Torque coefficient at a position on the rotor.	No
		Unit [-]	
		<ol> <li>Radius [m/s]</li> <li>Azimuth angle (zero downwards)</li> </ol>	
		[deg]	
aero	induc_sector_a	Axial induction coefficient at a position on	No
		the rotor. Unit [-]	
		1. Radius [m/s]	
		2. Azimuth angle (zero downwards)	
aero	induc sector am	[deg] Tangential induction coefficient at a position	No
delo	induc_sector_and	on the rotor. Unit [-]	110
		1. Radius [m/s]	
		2. Azimuth angle (zero downwards)	
		[deg]	
aero	induc_a_norm	Axial velocity used in normalization expression of rotor thrust coefficients. The	No
		average axial wind velocity incl. induction.	
		Unit [m/s]. No parameters.	
aero	induc_am_norm	Tangential velocity used in normalization	No
		expression of torque coefficient. Average	
		tangential velocity at a given radius. Unit	
		[m/s]. 1. Radius [m]	
aero	inflow angle	Angle of attack + rotation angle of profile	No
	_ 0	related to polar coordinates (not pitching).	
		Unit [deg]	
		1. Blade number2. Radius [m] (nearest inner	
		2. Radius [m] (nearest inner calculation point is used)	
aero	dcldalfa	Gradient $dCl/d\alpha$ . Unit [deg <sup>-1</sup> ]	No
		1. Blade number	
		2. Radius [m] (nearest inner	
		calculation point is used)	
aero	dcddalfa	Gradient $dCd/d\alpha$ . Unit [deg <sup>-1</sup> ]	No
		1. Blade number	
		2. Radius [m] (nearest inner	
		calculation point is used)	
aero	gamma	Circulation strength at calculation point.	No
		Unit [m <sup>2</sup> /s] 1. Blade number	
		2. Radius [m] (nearest inner	
		calculation point is used)	
aero	lambda	Tip speed rato, Unit []	No

Command 1	Command 2	Explanation	Label option
aero	windspeed_boom	<ul> <li>Free wind speed seen by a boom mounted on a blade section. Coordinate system used "blade ref. system". Unit [m/s].</li> <li>1. Blade number</li> <li>2. Radius [m] (nearest inner calculation point is used)</li> <li>3. Boom-length X, measured from half chord point positive towards LE [m]</li> <li>4. Boom-length Y, measured from half chord point positive towards pressureside [m]</li> </ul>	No
aero	actuatordiskload	Actuator disk load provide normalized load export for the Actuator Disk Model. 1. DOF (1=Ft, 2=Fa, 3=Fr) 2. Radius [m] (nearest inner calculation point is used)	No
aero	grid_radius_nd	Aerodynamic calculation point non-dim radius r/R 1. Number of radial stations outputted (should normally correspond to number of aerodynamic calculation points on a blade)	No
aero	vawt_induc_x	Induction for a VAWT outputted in tangential polar coordinates 1. disc number 2. azimuth number	No
aero	vawt_induc_y	Induction for a VAWT outputted in radial polar coordinates 1. disc number 2. azimuth number	No

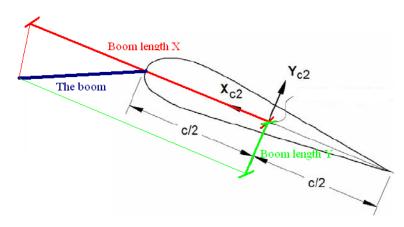

Illustration of the boom coordinates used by the "windspeed\_boom" command.

Command 1	Command 2	Explanation	Only	Label
			option	option
wind	free_wind	<ul> <li>Wind vector V<sub>x</sub>, V<sub>y</sub>, V<sub>z</sub>, (wind as if the turbine didn't exist).</li> <li>1. Coordinate system (1=global, 2=non rotating rotor coordinates (x always horizontal, y always out-of-plane))</li> <li>2. x-pos (global coo)</li> <li>3. y-pos (global coo)</li> <li>4. z-pos (global coo)</li> </ul>	Yes	Yes
wind	free_wind_hor	Horizontal wind component velocity [m/s] and direction [deg] defined to output. Dir=0 when wind equals y-dir. 1. Coordinate system (1=global, 2=non rotating rotor coordinates (x always horizontal, y always out-of-plane)) 2. x-pos (global coo) 3. y-pos (global coo) 4. z-pos (global coo)	Yes	Yes
wind	free_wind_shadow	As sensor "free_wind", but with tower shadow included. 1. Coordinate system (1=global, 2=non rotating rotor coordinates (x always horizontal, y always out-of-plane)) 2. x-pos (global coo) 3. y-pos (global coo) z-pos (global coo)	Yes	Yes

## wind (wind output commands)

## wind\_wake (wind wake output commands)

Command 1	Command 2	Explanation	Only option	Label option
wind_wake	wake_pos	Position of the wake deficit center after the meandering proces to the downstream end position. x,y and z position is written in meteorological coordinates $(x,y,z)_M=(u,v,w)$ with origo in the position defined with center_pos0 in the general wind commands. 1. wake source number	Yes	Yes

## dll (DLL output commands)

Command 1	Command 2	Explanation	Label option
dll	inpvec	Value from DLL input vector is defined to	yes
		output	
		1. DLL number	
		2. array index number	
dll	outvec	Value from DLL output vector is defined	yes
		to output	
		1. DLL number	
		2. array index number	

dll	hawc_dll	<ul> <li>Special output commands for the "hawc_dll" format. With this command the dll name can be used in the output definitions <ol> <li>string. Reference name of the dll given in the begin – end hawc_dll input definitions.</li> <li>string. "outvec" or "inpvec" can be used. Same definition as previously written above.</li> <li>Channel number in the in or out going array.</li> </ol> </li> </ul>	yes
dll	type2_dll	<ul> <li>Special output commands for the "type2_dll" format. With this command the dll name can be used in the output definitions <ol> <li>string. Reference name of the dll given in the begin – end hawc_dll input definitions.</li> <li>string. "outvec" or "inpvec" can be used. Same definition as previously written above.</li> <li>Channel number in the in or out going array.</li> </ol> </li> </ul>	yes

Command 1	Command 2	Explanation	Only	Label
			option	option
hydro	water_surface	Water surface level at a given horizontal location is defined to output (global coordinates). Unit [m] 1. x-pos 2. y-pos	No	No
hydro	water_vel_acc	Water velocity $V_x$ , $V_y$ , $V_z$ , and acceleration $A_x$ , $A_y$ , $A_z$ vectors defined to output. Unit [m/s] and [m/s <sup>2</sup> ]. 1. x-pos 2. y-pos 3. z-pos	Yes	No
hydro	fm	Inertia force F <sub>x</sub> , F <sub>y</sub> , F <sub>z</sub> contribution from Morisons formula in a given calculation point. Unit [kN] 1. hydro element number 2. sec number 3. coordinate system (1=global, 2=local hydro sec coo)	Yes	No
hydro	fd	Drag force $F_x, F_y, F_z$ contribution from Morisons formula in a given calculation point. Unit [kN]1. hydro element number2. sec number3. coordinate system (1=global, 2=local hydro sec coo)	Yes	No

# hydro (hydrodynamic output commands)

general (general output commands)	general	(general	output	commands)
-----------------------------------	---------	----------	--------	-----------

Command 1	Command 2	Explanation	Label option
general	constant	A constant value is send to output 1. constant value	No
general	step	A step function is created. This function changes from $f_0$ to $f_1$ at time $t_0$ . 1. $t_0$ [sec] 2. $f_0$ 3. $f_1$	No
general	time	The time is send to output. No parameters	No
general	deltat	The time increment is send to output. No parameters	No
general	harmonic	A harmonic function is send to output $F(t) = A \sin(2\pi f_0 t) + k$ 1. A 2. f_0 3. k	No
general	harmonic2	A harmonic function is send to output $F(t) = \begin{cases} 0 & t < t_0 \\ A \sin(2\pi f_0(t - t_0)) + k & t_0 \le t \le t_1 \\ 0 & t > t_1 \end{cases}$ 1. A 2. f_0 3. k 4. t_0 5. t_1	No
general	stairs	<ul> <li>A series of steps resulting in a staircase signal is created.</li> <li>1. t<sub>0</sub> time for first step change [s]</li> <li>2. f<sub>0</sub> start value of function</li> <li>3. Step size</li> <li>4. Step duration [s]</li> <li>5. Number of steps</li> </ul>	No
general	status	A status flag (mainly for controller purpose) is written. A first time step and first iteration the output value is 0. During the rest of the simulation the value is 1 until last time step where the value is -1.	No
general	random	A randon (uniform distribution) is written 1. lower limit 2. upper limit 3. seed number	No
general	impulse	A step function which return to zero after a certain duration 1. t <sub>0</sub> time for impulse start [s] 2. Impulse duration [s] 3. f <sub>0</sub> impulse level	No

# Output\_at\_time (output at a given time)

This command is especially usefull if a snapshot of loads or other properties are required at a specific time. This is mostly used for writing calculated aerodynamic properties as function of blade location. The command block can be repeated as many times as needed (e.g. if outputs at more than one time is needed)

#### The command must be written with the following syntax

#### output\_at\_time keyword time

where *keyword* is a command listed in the subsections below. Sofar only the command **aero** is present. The last command word *time* is the time in seconds from simulation start to which the output are written.

#### aero (aerodynamic output commands)

The first line in the output\_at block must be the information regarding which file the outputs are written (the filename command listed in the table below)

Command 1	Explanation	Label option
filename	Filename incl. relative path to output file	No
	(example ./output/output_at.dat).	
	1. filename	
alfa	Angle of attack [deg].	No
	1. Blade number	
alfadot	Pitch rate term (z-axis rotation) in local aerodynamic plane, as	No
	used for non-circulatory contributions. Unit [rad/s].	
	1. Blade number	
vrel	Relative velocity [m/s]	No
	1. Blade number	
cl	Lift coefficient [-]	No
	1. Blade number	
cd	Drag coefficient [-]	No
	1. Blade number	
cm	Moment coefficient [-]	No
1:0	1. Blade number	N
lift	Lift force L [N]	No
1	1. Blade number	N.
drag	Drag force D [N]	No
	1. Blade number	N.
moment	Moment force M [Nm] 1. Blade number	No
secforce	Aerodynamic forces [N]	No
sectorce	1. Blade number	INO
	2. DOF number $(1=x,2=y,3=z)$	
	3. Coordinate system $(1=aero, 2=blade, 3=global,$	
	4=rotor polar)	
secmoment	Aerodynamic moments [Nm]	No
seemonent	1. Blade number	110
	2. DOF number $(1=x,2=y,3=z)$	
	3. Coordinate system (1=aero, 2=blade, 3=global,	
	4=rotor polar)	
int_force	Aerodynamic forces integrated from tip to given radius [N]	No
	1. Blade number	
	2. DOF number $(1=x,2=y,3=z)$	
	3. Coordinate system (1=aero, 2=blade, 3=global,	
	4=rotor polar)	

Command 1	Explanation	Label option
int_moment	Aerodynamic moment integrated from tip to given radius [N]	No
	1. Blade number	
	2. DOF number $(1=x,2=y,3=z)$	
	3. Coordinate system (1=aero, 2=blade, 3=global,	
ininga	4=rotor polar)	Na
inipos	Initial position of sections in blade coo [m] 1. Blade number	No
	2. DOF number $(1=x,2=y,3=z)$	
position	Actual position of section [m]	No
position	1. Blade number	110
	2. DOF number $(1=x,2=y,3=z)$	
	3. Coordinate system (1=aero, 2=blade, 3=global,	
	4=rotor polar)	
velocity	Actual velocity of section [m/s]	No
	1. Blade number	
	2. DOF number $(1=x,2=y,3=z)$	
	3. Coordinate system (1=aero, 2=blade, 3=global,	
assalanation	4=rotor polar)	Na
acceleration	Actual acceleration of section [m/s] 1. Blade number	No
	2. DOF number $(1=x,2=y,3=z)$	
	3. Coordinate system $(1=aero, 2=blade, 3=global,$	
	4=rotor polar)	
ct local	Local thrust coefficient [-]. Calculated based on the expression	No
	$C_{t} = \frac{F_{axial} B}{\frac{1}{2}\rho 2\pi r V_{inf}^{2}}$	
	$\frac{1}{2}\rho 2\pi r V_{inf}^2$	
	1. Blade number	
cq_local	Local tangential force coefficient [-]. Calculated based on the	No
	expression	
	$C_q = \frac{F_{\text{tan}} B}{\frac{1}{2} \rho 2\pi r V_{\text{inf}}^2}$	
	$C_q = \frac{1}{\sqrt{\rho^2 \pi r V_{c}^2}}$	
	1. Blade number	
chord	Chord length [m]	No
enoru	1. Blade number	110
induc	Induced velocity [m/s]	No
	1. Blade number	
	2. DOF number $(1=x,2=y,3=z)$	
	3. Coordinate system (1=aero, 2=blade, 3=global,	
	4=rotor polar)	
windspeed	Free windspeed (without induction but incl. tower shadow	No
	effects if used) [m/s]	
	1. Blade number 2. DOE number $(1-n, 2-n, 2-n)$	
	<ol> <li>DOF number (1=x,2=y,3=z)</li> <li>Coordinate system (1=aero, 2=blade, 3=global,</li> </ol>	
	4=rotor polar)	
inflow angle	Angle of attack + rotation angle of profile related to polar	No
	coordinates (not pitching). Unit [deg]	110
	1. Blade number	
dcldalfa	Gradient $dCl/d\alpha$ . Unit [deg <sup>-1</sup> ]	No
	1. Blade number	
dcddalfa		No
uuuuana	Gradient $dCd/d\alpha$ . Unit [deg <sup>-1</sup> ]	110
	1. Blade number	
tiploss_f	The local Prandtl tiploss factor f is written	No
	1. Blade number	<u> </u>

Risø's research is aimed at solving concrete problems in the society.

Research targets are set through continuous dialogue with business, the political system and researchers.

The effects of our research are sustainable energy supply and new technology for the health sector.
