

How 2 HAWC2, the user's manual

Torben Juul larsen

Risø-R-1597(ver. 3-9)(EN)

Author: Torben Juul larsen
Title: How 2 HAWC2, the user's manual
Department: Wind Energy Division

Abstract (max. 2000 char.):

The report contains the user's manual for the aeroelastic code HAWC2. The code is intended for calculating wind turbine response in time domain and has a structural formulation based on multi-body dynamics. The aerodynamic part of the code is based on the blade element momentum theory, but extended from the classic approach to handle dynamic inflow, dynamic stall, skew inflow, shear effects on the induction and effects from large deflections. It has mainly been developed within the years 2003-2006 at the aeroelastic design research programme at Risoe, National laboratory Denmark, but is continuously updated and improved.

This manual is updated for HAWC2 version 8.7 – now draft edition for HAWC2 version 9.7.

Preface

The HAWC2 code is a code intended for calculating wind turbine response in time domain. It has been developed within the years 2003-2006 at the aeroelastic design research programme at Risoe, National laboratory Denmark.

The structural part of the code is based on a multibody formulation where each body is an assembly of timoshenko beam elements. The formulation is general which means that quite complex structures can be handled and arbitrary large rotations of the bodies can be handled. The turbine is modeled by an assembly of bodies connected with constraint equations, where a constraint could be a rigid coupling, a bearing, a prescribed fixed bearing angle etc. The aerodynamic part of the code is based on the blade element momentum theory, but extended from the classic approach to handle dynamic inflow, dynamic stall, skew inflow, shear effects on the induction and effects from large deflections. Several turbulence formats can be used. Control of the turbine is performed through one or more DLL's (Dynamic Link Library). The format for these DLL's is also very general, which means that any possible output sensor normally used for data file output can also be used as a sensor to the DLL. This allows the same DLL format to be used whether a control of a bearing angle, an external force or moment is placed on the structure.

The code has internally at Risoe been tested against the older validated code HAWC, the CFD code Ellipsys and numerous measurements. Further on detailed verification is performed in the IEA annex 23 and annex 30 research project regarding offshore application.

During the programming of the code a lot of focus has been put in the input checking so hopefully meaningful error messages are written to the screen in case of lacking or obvious erroneous inputs. However since the code is still constantly improved we appreciate feedback from the users – both good and bad critics are welcome.

The manual is also constantly updated and improved, but should at the moment cover the description of available input commands.

Acknowledgements

The code has been developed primarily by internal funds from Risø National Laboratory – Technical University of Denmark, but the research that forms the basis of the code is mainly done under contract with the Danish Energy Authority.

The structural formulation of the model is written by Anders M. Hansen as well as the solver and the linking between external loads and structure. The aerodynamic BEM module is written by Helge A. Madsen and Torben J. Larsen, where the near wake model is written by Helge A. Madsen and Peter Bjørn Andersen. Three different stall models are implemented where the S.Ø. (Stig Øye) model is implemented by Torben J. Larsen, the mhh Beddoes model is written by Morten Hansen and Mac Gaunaa and the mhhmacg model used for trailing edge flaps is written by Mac Gaunaa and Peter Bjørn Andersen. The wind and turbulence module as well as the soil and DLL modules are written by Torben J. Larsen. The hydrodynamic module is written by Anders M. Hansen and Torben J. Larsen. The turbulence generator is generated by the WAsP Team and

converted into a DLL by Peter Bjørn Andersen. The dynamic wake meandering module is written by Helge A. Madsen, Gunner Larsen and Torben J. Larsen. The eigenvalue solver is implemented by John Hansen. General maintenance is performed by Torben J. Larsen and Anders M. Hansen.

General input layout

The HAWC 2 input format is written in a form that forces the user to write the input commands in a structured way so aerodynamic commands are kept together, structural commands the same etc.

The commands are divided into command blocks using the begin-end syntax. Each line has to be ended with a semi colon “;” which gives the possibility for writing comments and the end of each line after the semi colon. All command lines can be written with capital or small letters, but inside the code all lines are transformed into small letters. This could have importance if something case sensitive is written (e.g. the name of a subroutine within a DLL).

```
begin simulation;
  time_stop    100.0 ;
  solvetype    1 ;    (newmark)
;
  begin newmark;
    beta       0.27;
    gamma      0.51;
    deltat     0.02;
  end newmark;
end simulation;
```

In the next chapters the input commands are explained for every part of the code. The notation is main command for a begin-end command block that is not a sub part of another begin-end block, and sub command block for a begin-end block that is included within another block. In the above written example “simulation” is a main command block and “newmark” is a sub command block.

Continue_in_file option

A feature from version 6.0 and newer is the possibility of continuing reading of the main input file into another. The command word **continue_in_file** followed by a file name causes the program to open the new file and continue reading of input until the command word **exit**. When **exit** is read the reading will continue in the previous file. An infinite number of file levels can be used.

Command name	Explanation
continue in file	1. File name (and path) to sublevel input file
exit	End of input file. Input reading is continued in higher level input file.

HAWC2 version handling

The HAWC2 code is still frequently updated and version handling is therefore of utmost importance to ensure quality control. For every new released version of the code a new version number is hard coded in the source. This number can be found by executing the HAWC2.exe file without any parameters. The version number is echoed to screen. The same version number is also written to every result file no matter whether ASCII or binary format is chosen. Hereby it is possible to reproduce all results at later stage and to dig in the source code for at previous version if special problems occur.

All information covering the different code versions has been made. These data are listed on the next pages.

Risø DTU

!	Version information: Version name	! Date	Resp	Info
!	global%version='HAWC2MB 1.0'	! 20.04.2006	TJUL	Version system started. Changes in so_dyn_stall model performed.
!		! 24.04.2006	TJUL/ANMH	Bearing3 in topology - slight modification still needed, but now mhha needs a version
!	global%version='HAWC2MB 1.1'	! 25.04.2006	TJUL	mhha laptop in MAC check, integer overflow negletec in compiler settings
!	global%version='HAWC2MB 1.1work'	! 26.04.2006	TJUL	tjul stationairy pc in MAC check
!		! 28.04.2006	TJUL	New check regarding thicknesses in aeodynamic files
!	global%version='HAWC2MB 1.2'	! 28.04.2006	TJUL	ktth stationairy pc in MAC check
!	global%version='HAWC2MB 1.3'	! 01.05.2006	TJUL	Radius non-dim in structural _st input data and aerodynamic _ae data
!				Extra check in structural files reading procedures
!				Tab characters can now be used in htc files and other input files
!				Check that c2_def structure length larger than eps
!	global%version='HAWC2MB 1.4'	! 02.05.2006	TJUL	New check in hawc_file output that time_stop>time_start
!				Topologi_timoschenko.f90 updated related to changes in version 1.3
!	global%version='HAWC2MB 1.5'	! 03.05.2006	TJUL	ktth laptop in MAC check
!				Get_state_rot function in body.f90
!				New mbdy state_rot output command in topologi_mainbody_output
!				Rotation velocity and acceleration in aerodynamic blade section variables
!			MACQ/TJUL	Dynamic_stall_mhh included
!	global%version='HAWC2MB 1.6'	! 04.05.2006	TJUL	Extension of bladepc criteria for execution stop
!	global%version='HAWC2MB 1.7'	! 09.05.2006	TJUL	New error message in windturb_mann.f90
!				New error messages regarding matrix not definite problems
!				New MAC checks (Niels Kjølstad + students)
!	global%version='HAWC2MB 1.8'	! 09.05.2006	TJUL	New MAC check
!	global%version='HAWC2MB 1.9'	! 16.05.2006	TJUL	New MAC check
!	global%version='HAWC2MB 2.0'	! 18.05.2006	TJUL	New MAC check
!	global%version='HAWC2MB 2.1'	! 19.05.2006	TJUL	Error messages corrected in mbdy state_rot command
!			MHHA/TJUL	New MAC check procedure (loop over all addresses instead of only one)
!	global%version='HAWC2MB 2.2'	! 22.05.2006	TJUL	New ignore function in body actions
!		! 30.05.2006	TJUL	Old MAC check procedure reimplemented since troubles occurred with the new version
!	global%version='HAWC2MB 2.3'	! 30.05.2006	TJUL	Replacement of procedure that calculates euler parameters based on transformation matrix
!				(only important for cases with eulerp output used)
!	global%version='HAWC2MB 2.4'	! 31.05.2006	TJUL	General cleanup in multibodyproto.f90 file (simple generator model excluded, now tmp_gen_speed output command is excluded)
!		! 01.06.2006	TJUL	New MAC checks
!	global%version='HAWC2MB 2.5'	! 04.06.2006	TJUL	External Licence manager DLL used. Avoids new versions of the HAWC2 code to be build at every new MAC number and and also works when the computer is not connected to a LAN
!		!		Newmark variables reorganized
!	global%version='HAWC2MB 2.6'	! 13.06.2006	TJUL	Hydrodynamic loads cut-in at 2secs, as for the aero loads. To reduce initial transients
!		!		New acceptance criteria from License manager
!		!		New input check in topologi_mainbody
!		!		Order of radius of gyration input shifted for the new_htc_structure input. Now: 1 st column (Rix) is the one affected if mass center position changes on the chord line
!	global%version='HAWC2MB 2.7'	! 23.06.2006	ANMH	Normalisation of vectors in utils funtions get_two_plane_vectors. Used for better accuracy in bearing1 and bearing2 definitions

!	global%version='HAWC2MB 2.8'	! 17.07.2006	TJUL/FRBA	Correction of bug in get_ae_data procedure in aeroload_calcfoces unit. Profile sets
!				higher than one is now also usable.
!	global%version='HAWC2MB 2.9'	! 17.07.2006	TJUL	Gravity loads cut-in at 0.5secs, same method as for the aero loads. To reduce initial transients
!				Harmonic2 function in general output (time limited harmonic function)
!	global%version='HAWC2MB 3.0'	! 24.07.2006	TJUL	topologi_mainbody_actions module added. New features to the actions list.
!	global%version='HAWC2MB 3.1'	! 26.07.2006	TJUL	Mann turbulence is reused if simulation time is longer than included in turbulence box
!	global%version='HAWC2MB 3.2'	! 28.07.2006	TJUL	Correction of bug in aerodynamic moment integration procedure (only related to aerodynamic file output)
		! 31.07.2006	TJUL	Change of error message criteria regarding allowable number of bodies within a mainbody (<n elements)
		! 01.08.2006	TJUL	Correction of bug in dynstall_mhh model so no division by zero occurs when a zero lift profile is used.
!	global%version='HAWC2MB 3.3'	! 01.08.2006	ANMH	Correction of bug related to torsion of blade in the blade linker
		! 04.08.2006	TJUL	Check applied on exp expressions in dynamic stall mhh model to avoid underflow errors
!	global%version='HAWC2MB 3.4'	! 09.08.2006	TJUL	New check applied in mann turbulence unit to avoid array out of bounds during bizar startup transients
!		! 11.08.2006	TJUL	Correction of exp check in dynstall_mhh model just created in version 3.2
!	global%version='HAWC2MB 3.5'	! 28.08.2006	TJUL	Generator_rotation sensor setup for old_htc_structure format - replaces the older tmp_gen_speed sensor. Updates in hawcstructure.f90 and body_output.f90
!		!		New error message in body_output
!		!		Improvement of general command reader in genout_tools in order to accept tabulator spacings
		!		General shine up of aerodynamic calculations regarding induction and tiploss calculations rechecked against IEA rev 3 calculations
		!		Number of radial point in the induction calculation is default set to the name number as number of aero sections. Previous default of 30 stations
		!		Linear interpolation in aeroload_tools updated so no division by zero occurs when x0=x1, used in cases where extrapolation is not wanted
		! 29.08.2006	ANMH/TJUL	Fix1 constraints updated in topologi_constraints_fix1.f90 and hawcstructure.f90. Ensures e.g. that constraint properties are identical for blades. Ensures that blades performs identically.
!	global%version='HAWC2MB 3.6'	! 14.09.2006	TJUL	New acceptance criteria from license manager
!	global%version='HAWC2MB 3.7'	! 15.09.2006	TJUL	New general load linker that replaces bladelink.f90 and wavelink.f90
		!	ANMH/TJUL	Pitchsensors (bearing sensor) updated during iterations too. Especially important for DLL controllers
!	global%version='HAWC2MB 3.8'	! 06.10.2006	TJUL	Correction of bug related to aero int_force and int_moment sensors
		!		Correction of bug in DLL actions. On nodes different from nr. 1, in- and external forces and moments were placed on the node 1 number lower.
		!	TJUL	Pitch sensor modified. Now pitch velocity is calculated based on numerical differentiation of calculated angle. Should be less sensitive to solver inaccuracies.
		!	TJUL	In output of bearing sensor new options are added. (-180:180 deg output etc.)
		!	ANMH	Correction of bug in loadlinker. It turned out that loadfunction were only correct if an even number of calculation points were used (aero or hydro). Now OK also for odd numbers
!	global%version='HAWC2MB 3.9'	! 06.10.2006	TJUL	Soil spring module added (soil stuff from hydro module removed)
!	global%version='HAWC2MB 4.0'	! 02.11.2006	TJUL	Extra output commands in aero output_at
!	global%version='HAWC2MB 4.1'	! 02.11.2006	ANMH/TJUL	Replacement of added stiffness method for soil springs. Much better and faster than previous. Still not perfect.

	! 10.11.2006	ANMH/TJUL	Update of bearing3. Now it is general.	
	! 10.11.2006	TJUL	Output variables rearranged. Only command included in bearing outputs	
	! 10.11.2006	TJUL	Topologi input modified so many bases are allowable.	
	! 15.11.2006	ANMH/TJUL	Files synchronized with Anders. Slight update in dll_calls, dll_types and windturb_mann.	
!	global%version='HAWC2MB 4.2'	! 16.11.2006	TJUL	Rearrangement of output/action sensor allocation. Reduces .exe size from 23MB to 2.3MB
		!	TJUL/HAMA	Correction of sensors induc and windspeed in output_at aero. They were previously in a wrong coordinate system when written to output_at.
!	global%version='HAWC2MB 4.3'	! 17.11.2006	TJUL	New fix3 constraint. Locks a node to ground in a given rotation direction.
		! 23.11.2006	ANMH	Update of loadlinker with respect to procedures for numerical update of stiffness, damping and mass terms. Improves solutions of soil spring systems significant.
		! 27.11.2006	TJUL	Same procedure used for the hydrodynamic part => faster convergence.
!	global%version='HAWC2MB 4.4'	! 27.11.2006	TJUL	Bug fixed related to input for action sensor: mbdy moment_int index+7 -> index+6 in body_get_state_rot subroutine. Affects orientation of all local load elements in load linker.
		! 04.12.2006	ANMH	
!	global%version='HAWC2MB 4.5'	! 06.12.2006	TJUL	New sensors in aero module.
		!		Out of bounds bug in aero output_at corrected
		! 07.12.2006	ANMH	Files used in topologi_tools are closed after use.
		! 12.12.2006	TJUL	In make output command, outputs are bypassed if global time > output stoptime
		! 13.12.2006	TJUL	In mann turbulence a new command (dont_scale) is made.
		! 21.12.2006	TJUL	Update of HAWC_mann module. Important only if turbulence outside box is used.
		! 04.01.2007	TJUL	omega vector for aerodynamic module in rotor reference coordinates. In aero files only rotation speed around y-axis is used. Eliminates influence from e.g. pitch velocity
		! 04.01.2007	MHHA/TJUL	New optional relaxation parameter for solver. Extra command in simulation input.
!	global%version='HAWC2MB 4.6'	! 12.01.2007	ANMH	Change of sign in forcedll.f90. Important only if an external force dll as coupled springs are used. Not important for hawc_dll
!	global%version='HAWC2MB 4.7'	! 06.02.2007	ANMH/TJUL	Update of code structure, multibodyproto split into several subroutines
		!		New logical variables related to simulation_input
		!		New state_at in mbdy output

!	global%version='HAWC2MB 4.9'	! 12.02.2007	TJUL	new error message in turbulence input reader
		! 19.02.2007	TJUL	New potential flow tower shadow model where source is linked to tower motion
	global%version='HAWC2MB 5.0'	! 26.02.2007	TJUL	New mbdy state_rot output option: orientation in euler angles defined through the rotation order xyz
!	global%version='HAWC2MB 5.1'	! 27.02.2007	TJUL	Correction of method used to calculate mbdy state_rot rotation in general
!				New mbdy state_rot output option: orientation in euler angles defined through the rotation order yxz
!				Small adjustments in DLL_output to avoid array out of bounds when long mbdy names are used
!	global%version='HAWC2MB 5.2'	! 02.03.2007	ANMH/TJUL	Bug fixed related to continue_on_no_convergence criteria
!			TJUL	HAWC2MB version echoed to screen before input is read.
!			TJUL	New licence manager compiler option
!	global%version='HAWC2MB 5.3'	! 13.03.2007	ANMH/TJUL	Bug fixed related to bearing3. Somehow the coupling nodes was not defined since version 4.0 It affects the transfer of loads from bearing3 and further dow the tower.
!	global%version='HAWC2MB 5.4'	! 21.03.2007	TJUL/ANMH	Eigenfrequency analysis feature added. Performs analysis on every individual body
!		!	TJUL	Some pointer nullify's are changed to deallocate(pointer).

!	global%version='HAWC2MB 5.4'	! 21.03.2007	TJUL/ANMH	Eigenfrequency analysis feature added. Performs analysis on every individual body
!		!	TJUL	Some pointer nullify's are changed to deallocate(pointer).
!	global%version='HAWC2MB 5.5'	! 29.03.2007	TJUL	Small change in constraint bearing2 action input. Now only 4 parameters nessecairy as was allways the idea.
!	global%version='HAWC2MB 5.6'	! 10.04.2007	TJUL	Bug fix related to number of output sensors in DLL output
!		!	ANMH	Change in external force module force_dll.f90. Update sequence of affected body changed.
!		!	TJUL	body_update_T is called in the end of post_init in order to allow for added stiffness, damping etc. by the rest of the initialization subroutines.
!	global%version='HAWC2MB 5.7'	! 16.04.2007	TJUL	Small update of continue on no convergence
!	global%version='HAWC2MB 5.8'	! 18.04.2007	TJUL	Mann turbulence files is closed after every buffer read. To allow several simulations acces to the same turbulence files.
!				New initial buffer read so out of x-bounds errors are avoided. Uses periodicity of turbulence boxes. In principal this allows for infinitely large simulations.
!	global%version='HAWC2MB 5.9'	! 23.04.2007	TJUL	Opening of mann turbulence boxed with loops and waits so several simulations can acces the same turbulence.
		! 26.04.2007	TJUL	Only option in mbody output, wind output, hydro output
				S0 dynamic stall input parameters put in as default. No need for parameter input if not changed.
		! 23.05.2007	TJUL	Check that turbulence scale_time_start is less the total simulation length
!				Correction of bug related to "only" option for output for main_body, wind and hydro output commands
	global%version='HAWC2MB 6.0'	! 01.06.2007	TJUL	New error check that animation can be written to. Error message if not.
		! 08.06.2007	TJUL	New possibility of continuing read in masterfile in a new file with the command:'continue_in_file'. Infinite number of level can be made.
				Filename also written to logfile when line number is written.
		! 15.06.2007	TJUL	Logfile_name command option in simulation_input. Enables file written logfiles. Error messages more clear with *** ERROR *** as key word
		! 08.08.2007	TJUL	Aerodynamic drag forces on structures enables with the new module aerodrag.
!	global%version='HAWC2MB 6.1'	! 03.09.2007	TJUL	Corrections made in continue_in_file option. End of file check removed replaced with exit command.
-		! 03.09.2007	ANMH	New unitnumber used when turbulence files are reopened. To avoid unit mismatch especiall
		! 05.09.2007	TJUL	Bug fixed in hydroload module. Only important when more than one hydro element are used.
		! 06.09.2007	TJUL	Bug fixed in hydroload module. Important if hydroelements have different coo than global.
		! 07.09.2007	TJUL	Bug fixed in hydroload module. Important if relative z_distances has been used as hydro element input
	global%version='HAWC2MB 6.2'	! 20.09.2007	PBJA/TJUL	Dynamic stall module that combines the mhh Beddoes stall model with the MACflap model. Coded by PBJA, implemented by TJUL.
	global%version='HAWC2MB 6.3'	! 10.10.2007	TJUL	New general output command "general stairs" for a series of step functions.
	global%version='HAWC2MB 6.4'	! 29.10.2007	TJUL	Some files synchronized with HAWC2aero regarding !IFDEF compiler directives

!	global%version='HAWC2MB 6.5'	! 04.01.2008	TJUL	User defined turbulence scaling implemented. Similar in principle to user defined shear.

		! 17.01.2008	TJUL	Bearing3 omegaS action command implemented to enable rotor speed control directly from external DLL
		! 04.02.2008	ANMH	Bouyancy forces calculated based on external pressures
	!		TJUL	Prestress constraint fix4
	!			DLL call to external wake kinematics dll changed. E.g. dynamic pressure added
!	global%version='HAWC2MB 6.6'	! 04.02.2008	TJUL	bearing4. Cardan shaft constraint. Locked in relative translation.
		! 08.02.2008	TJUL	Locked in rotation around one vector
		! 08.02.2008	TJUL	Bug fixed in turbulence module affecting version 5.5.
		! 08.02.2008	TJUL	Bug fixed regarding turbulence scaling factors. In version 6.5 the turbulence was excluded for normal use - corrected.
		! 11.02.2008	TJUL	Previous .dat file deleted when hawc_binary output files are written.
		! 11.02.2008	TJUL	In mann and flex turbulence module: std scaling factors default to v=0.8 u=1.0 w=0.5
		! 11.02.2008	TJUL	Bug fixed regarding IEC-gust EWS
		! 13.02.2008	TJUL	New Auto distribution of hydrodynamic calculation points possible
		! 13.02.2008	TJUL/ANMH	Bug fixed regarding hydrodynamic boyancy. Axial force on conical members changed from distributed forces to constant force contributions instead (to decrease sensitivity to number of hydro points)
	!			F function only on external kinematics in hydro module.
	!			Dynamic pressure contribution include. Also in wkin_dll calling format.
	!			Coordinates in wkin_dll call changed from global to local hydro coo (origo in 0,0,MSL Z-dir vertical upwards, X-dir in wave direction)
	!			Change in hydro output command "fm" and "fd"
		! 15.02.2008	TJUL	trim commands inserted in reading of master input "begin" and "exit" commands.
		! 15.02.2008	TJUL	Bug fixed regarding output of "free_wind_hor" command.
		! 19.02.2008	TJUL	S.O. dynamic stall parameters included as default
!	global%version='HAWC2MB 6.7'	! 26.02.2008	TJUL	Bug fixed regarding mbdy action command with "local" coordinates
		! 27.02.2008	TJUL	Extra error messages for errors during aero read routines
		! 29.02.2008	TJUL	Small modifications in eigenvalue solver so large eigenvalue problem can be solved without very large stack size
		! 06.03.2008	TJUL	Dynamic pressure on conical sections also in hydroload
		! 09.03.2008	TJUL	Wordlength increased to 100 chars in general input reading.
		! 11.03.2008	TJUL	Error handling for infinity cases in hawc_binary output
		! 11.03.2008	ANMH/TJUL	Dynamic pressure on conical hydro sections
		! 11.03.2008	TJUL	Update of mann turb reading routines for boxes where N_y<>N_z
		! 11.03.2008	TJUL	Small modifications in the wake module for robustness
		! 13.03.2008	TJUL	Update of mann turb reading so buffer is updated also when requested point is before buffer start pos (especially important for wake sim. with several wake sources)
!	global%version='HAWC2MB 6.8'	! 14.03.2008	TJUL	Update of tower shadow pot2 and jet2 models, so they can handle multiple sources.
!	global%version='HAWC2MB 6.9'	! 21.03.2008	TJUL	Increase of maxloops in mann turbulence reading.
!	global%version='HAWC2MB 7.0'	! 09.04.2008	TJUL	New check in license_manager
!	global%version='HAWC2MB 7.1'	! 21.05.2008	TJUL	Bug fixed in command line interpreter (if too many command words were present)
		! 26.05.2008	ANMH/TJUL	Concentrated masses option in main_body (no coriolis effects etc. so far)
		! 11.06.2008	TJUL	Extra acceleration sensor including gravity
		! 13.06.2008	TJUL	Minimum values of rotational speed and free wind speed in the induction module.
!	global%version='HAWC2MB 7.2'	! 15.06.2008	TJUL	F startup function and relative motion in aerodrag included
!	global%version='HAWC2MB 7.3'	! 22.07.2008	TJUL	extra check on shear power law expression in wind module to avoid NAN's
		! 01.08.2008	TJUL	Concentrated mass in modal calculation
				Bug in calculation procedure of aerodynamic torque and power corrected.
				Bug in tower shadow pot2 and jet2 models corrected. Important only if rotation of tower legs were present.

!	global%version='HAWC2MB 7.4'	! 05.08.2008	ANMH	Change in output of forces/moments in general. More correct when long elements are used.
	!		ANMH	Distributed external loads, inertial loads included on top of elastic part. Previously only elastic part used.
		! 06.08.2008	TJUL/HAMA	Hydrodynamic axial drag possible
	global%version='HAWC2MB 7.5'	! 08.08.2008	TJUL	Bearing 2 updated to allow for +/-180deg rotation
!	global%version='HAWC2MB 7.6'	! 24.09.2008	TJUL	Update of tower shadow 2 models. Factors multiplied instead of deficits added. Better when several tower shadow sources are used.
	global%version='HAWC2MB 7.7'	! 01.10.2008	TJUL	Correction of matrix conditioning during eigenvalue calculations. Version 7.3 and 7.4 was not correct regarding this!
		!		Bug fixed in tower pot2 model.
		! 08.10.2008	PBJA/TJUL	Old LIB files for old HAWC input format read, removed from project
		! 08.10.2008	TJUL	Extra logfile output regarding load linking.
	global%version='HAWC2MB 7.8'	! 10.10.2008	TJUL	NEED EXTRA ATTENTION -NOT COMPLETELY FIXED YET- WORK ONLY when body structure is defined along the body z coordinates!
		!		Bug fixed in aerodrag module (important if aerodrag is linked to a structure where local element and body coo does not coincide)
		! 10.10.2008	TJUL	Mann turbulence generator DLL call added
		! 10.10.2008	TJUL	Warning written if a comma "," is written within a command line
		!		Animation files for structure eigenvalues calc placed in same directory as eigenvalue list
	global%version='HAWC2MB 7.9'	! 17.11.2008	TJUL	Limitations in orientation_relative removed. Any coupling node can now be chosen. Eigenvalue solver however not updated for this option yet.
		!		Extra subroutines in normal DLL hawc_dll call. Subroutines added: init and message.
		! 18.11.2008	TJUL	Directories needed are now automatically created if they do not exist
		! 19.11.2008	TJUL	A status sensor is added in the general outputs.
		! 19.11.2008	TJUL	Solvertype is default set to 1=newmark
		! 20.11.2008	TJUL	In dynamic wake model, downstream distance without offset, makes better agreement with measurements and FIDAP
		!		In Dynamic Wake Model: Possibility of writing file with Ct and Cq data
		! 21.11.2008	TJUL	Change in force DLL module. Now bodyname refers to a main_body
		! 21.11.2008	ANMH	Update of initial hydrodynamic loads for added mass/stiffness calculation
		!		Update of loadlinker and solver wrt. calculation of added mass/stiffness/damping.
		!		Asymmetric solver implemented - to improved convergence for hydrodyn. problems(not active in version 7.9)
	global%version='HAWC2MB 8.0'	! 28.11.2008	TJUL	In wake meander model. User calculated deficits can be read.
		! 02.12.2008	TJUL	Change in error message of tower shadow jet and jet2 model - when points requested is inside tower.
		!		General output sensor "status" is set to -1 in last time step.
		! 03.12.2008	PBJA	Near wake induction model implemented
		! 03.12.2008	PBJA	Possibility of exporting wind field including shear, tower shadow, wake etc.
		!		In normal induction model. First order time filter on induced velocities replaced with two indicial functions - modified filter approach. Better agreement with NASA AIMEs experiment.
		!		Bug correction of concentrated mass indexing in eigenvalue calculation. Important (only) if mass is connected to body node 1
		!		Possibility of calculating structural natural frequencies without damping contribution. More robust calculation
	global%version='HAWC2MB 8.1'	! 09.01.2009	TJUL	In mann model. Auto generation of missing turbulence in more general form.
		!		In hydro module. Currents included, wave direction included.
		!		Assymmetric solver option, which decreases number of iterations for offshore simulations considerable. Newmark-symmetric option
!	global%version='HAWC2MB 8.2'	! 20.01.2009	TJUL	Bug found in version 8.0 regarding Dynamic wake meander model. Input

	global%version='HAWC2MB 8.3'	! 21.01.2009	TJUL	deficits to Aislie model with wrong value in last radius point.
		! 02.02.2009	TJUL	Rearrangement of write procedure for final deficit in Dynamic wake
		! 27.02.2009	TJUL	meander model. Array-out-of-bound could occur in special cases
		! 11.03.2009	ANMH/TJUL	New twist angle sensor in output_at aero commands
		! 18.03.2009	HAMA/TJUL	Small correction of tip loss model. sin(phi) instead of phi.
				Update of modal solver. Now also usable for floating systems.
		! 05.05.2009	ANMH	Update of Dynamic wake meander model. Deficit are now more narrow than
				previous. Default parameters k1,k2 are changed.
		! 05.05.2009	TJUL	Bug fix in mass matrix and orthogonally of local orientation matrices.
				Important (only) with prebend and mass center offset from elastic axis.
		! 05.05.2009	ANMH	Small updates regarding mbdy commands instead/supplementary to old body
				commands in new_htc_structure inputs
		! 06.05.2009	TJUL	Extra parameter in hydro element regarding linear axial drag
!	global%version='HAWC2MB 8.4'	! 11.05.2009	TJUL	contribution.
!				More residual information outputted in case of no convergence
		! 12.05.2009	ANMH	New input check on number of mann box points. power of 2 criteria.
		! 13.05.2009	TJUL	Mode shape animation files written in appropriate directories.
				Initialization of timosection properties
!	global%version='HAWC2MB 8.5'	! 14.05.2009	ANMH	No double eigenvalue sets are written in table of structural
!	global%version='HAWC2MB 8.6'	! 08.07.2009	TJUL	frequencies
				Bug corrected in eigenvalue solver related to version 8.3 and 8.4
		! 08.07.2009	TJUL	Bug fix related to mann turbulence look-up indexes for points just
				outside the turbulence box.
	global%version='HAWC2MB 8.7'	! 24.08.2009	TJUL	New updates of DWM wake model. New ainslie-15.exe and modification of
				default parameters.
		! 30.08.2009	TJUL	In main_body input limitation of 4 c2def points lower to 2. If less
				than 4 points, linear interpolation is used.
		! 04.09.2009	ANMH	Element coordinates can now be used without limitations. Local
				coordinate system written in beam_output_file.
		! 04.09.2009	TJUL	Loadlinker updated so arbitrary body coordinations systems can be used.
				Linker now follows local curved beam direction
				Positive definite damping model originally formulated by Morten H.
				Hansen is included in HAWC2. Makes it possible to utilize the shear
				center position away from the elastic axis without problems with
				damping model.
!	global%version='HAWC2MB 8.8'	! 05.09.2009	TJUL	Small bugfix related to aerodrag module.
!	global%version='HAWC2MB 8.9'	! 08.10.2009	TJUL	Bug related to damping model changes in version 8.7 corrected.
	global%version='HAWC2MB 9.0'	! 09.10.2009	ANMH/TJUL	New structure output: Structure_inertia_file_name
		! 26.11.2009	TJUL	New check for input errors regarding negative diameters in aerodrag
				module
		! 03.12.2009	TJUL	In wake model. Ainslie-15.exe replaced by ainslie-15.dll, to enable
				execution on linux platforms using WINE
		! 21.12.2009	TJUL	In wake model. Bug fixed dealing with several neighbouring wind
				turbines. Change in turbine order for ainslie15.dll input/output
		! 30.12.2009	TJUL	Flex integer format option in output.
		! 04.01.2010	TJUL	Change in variables in eigenvalue module to avoid stack errors
		! 05.01.2010	TJUL	Change in loadlinker merge criteria to avoid error with closely spaced
				nodes
		! 31.01.2010	TJUL	New control DLL module names type2_dll
		! 31.01.2010	TJUL	Possibility to input case_sensitive words using ' symbols. Especially
				related to control subroutine names.
		! 15.02.2010	TJUL	Change in wind shear logarithmic format to ensure a shear of zero below
				global zero.
	global%version='HAWC2MB 9.1'	! 29.03.2010	TJUL	New parameter possible in mbdy moment_int actions command
		! 31.03.2010	ANMH	Possibility of external systems solved together with HAWC2, this goes
				for bodies and constraints
		! 01.04.2010	TJUL	Small update of result file sensorlist output for hawc_ascii and
				hawc_binary

	! 15.04.2010	TJUL	Updates in FORCE DLL module. New initialization option, label option.
	! 17.05.2010	TJUL	Update of wind ramps to speed up simulation time
	! 29.06.2010	TJUL	DLL module, type2_dll updated regarding first outputs in dll calls
	! 16.07.2010	TJUL	Small change in compiler settings.
global%version='HAWC2MB 9.2'	! 13.08.2010	TJUL	Possibility for aerodynamic sections positioned according to ae_file input.
	! 25.08.2010	TJUL	Updated procedure for hub coo which defines coo with arbitrary rotor orientation
	! 09.09.2010	TJUL	Simulation stop enabled by external dll action.
	! 13.09.2010	JOMH	Updated eigenvalue solution procedure
	! 13.09.2010	JOMH	Zero-termination of all strings used for dll's
	! 28.09.2010	TJUL	Bug correction from version 9.1 regarding wind steps.
! global%version='HAWC2MB 9.3w'	! 06.10.2010	TJUL	Bug correction in interpolation of profile coef when several pc sets are used.
	! 20.10.2010	TJUL	Bug correction of predictor in newmark solver. Version 9.0 and 9.1 gave problems coupling in controllers
	! 21.10.2010	TJUL	Eigenvalue solver from version 9.2 removed and old 9.1 version included instead. Not correct solutions in all cases.
	! 21.10.2010	TJUL	Turbulence buffer not updated when buffer contains the full turbulence box.
! global%version='HAWC2MB 9.4'	! 21.10.2010	TJUL	Code updated for handling multiple aerodynamic rotors
	! 26.10.2010	TJUL	Be aware that the near wake induction model is not working in this edition. The normal induction model works fine though.
	! 26.10.2010	JOMH	Eigenvalue solver updated again, so now it should be both correct and robust
! global%version='HAWC2MB 9.5'	! 12.11.2010	TJUL	Bug fixed when outputting wake pos when no wake defined - code crash occurred.
	! 17.11.2010	TJUL	BEM rewritten in more structured way and to make sure local properties in grid points are all local. More correct for non-uniform loading
	! 19.11.2010	TJUL	IN BEM, time filters are now on induced velocities instead of factors, same goes with azimuthal yaw correction in induction.
	! 21.11.2010	TJUL	WSP lookup only performed for first iteration to save simulation time.
! global%version='HAWC2MB 9.6'	! 24.11.2010	TJUL	Final adjustments of BEM induction
	! 27.11.2010	TJUL	Improvements of yaw correction in BEM calculation, comparison with FIDAP
	! 02.12.2010	TJUL	Bugfix related to output of DWM wake position
global%version='HAWC2MB 9.7'	! 03.12.2010	TJUL	Improvements of yaw correction in BEM calculation, comparison with FIDAP
	! 03.12.2010	TJUL	BEM restructured for more correct local CT prediction, time constants on induced velocities, yaw correction on induced axial velocities instead of factors
	! 03.12.2010	TJUL	BEM improved regarding aerodynamic yaw correction, compared with actuatordisc results
	! 03.12.2010	TJUL	BEM improved regarding dynamic time constants, compared with actuatordisc results
	! 03.12.2010	TJUL	Dyn. time constants reduced for first 10seconds to reduce time for initial equilibrium

Coordinate systems

The global coordinate system is located with the z-axis pointing vertical downwards. The x and y axes are horizontal to the side.

When wind is submitted, the default direction is along the global y-axis. Within the wind system meteorological u,v,w coordinates are used, where u is the mean wind speed direction, v is horizontal and w vertical upwards. When x,y,z notation is used within the wind coo. this refers directly to the u,v,w definition.

Every substructure and body (normally the same) is equipped with its own coordinate system with origo in node1 of this structure. The structure can be arbitrarily defined regarding orientation within this coordinate system. Within a body a number of structural elements are present. The orientation of coordinate systems for these elements are chosen automatically by the program. The local z axis is from node 1 to 2 on the element.

The coordinate system for the blade structures must be defined with the z axis pointing from the blade root and outwards, x axis in the tangential direction of rotation and y axis from the pressure side towards the suction side of the blade profiles. This is in order to make the linkage between aerodynamics and structure function.

Figure 1. Illustration of coordinate system as result of user input from example in section Example of main input file at page 86. There are two coordinate systems in **black** which are the default coordinate systems of global reference and default wind direction. The **blue** coordinate systems are main body coordinate systems attached to node 1 of the substructure, the orientation of these are fully determined by the user. The **red** coordinate systems are also defined by the user, but in order to make the linkage between aerodynamic forces and structure work these have to have the z from root to tip, x in chordwise direction and y towards the suction side.

Simulation

Main command block - Simulation

This block shall be present when time simulations are requested – always.

Obl.	Command name	Explanation
*	time_stop	1. Simulation length [s]
	solvertype	1. Choice of available solver method (1=newmark)
	solver_relax	1. Relaxation parameter on increment within a timestep. Can be used to make difficult simulation run through solver when parameter is decreased, however on the cost of simulation speed. Default=1.0
	on_no_convergence	Parameter that informs solver of what to do if convergence is not obtained in a time step. 1. 'stop': simulation stops – default. 'continue': simulation continues, error message is written.
	convergence_limits	Convergence limits that must be obtained at every time step. 1. epsresq, residual on internal-external forces, default=10.0 2. epsresd, residual on increment, default=1.0 3. epsresg, residual on constraint equations, default=0.7
	max_iterations	1. Number of maximum iterations within a time step.
	animation	Included if animation file is requested 1. Animation file name incl. relative path. E.g. ./animation/animation1.dat
	logfile	Included if a logfile is requested internally from the htc command file. 1. Logfile name incl. relative path. E.g. ./logfiles/log1.txt

Sub command block – newmark

This block shall be present when the solvertype is set to the newmark method.

Obl.	Command name	Explanation
	beta	1. beta value (default=0.27)
	gamma	1. gamma value (default=0.51)
*	deltat	1. time increment [s]
	symmetry	1. Solver assumption regarding mass, damping and stiffness matrices (1=symmetric (default), 2=assymmetric (recommended for offshore structures). When hydrodynamic loading is applied this parameter will automatically change to 2.)

Structural input

Main command block – new_htc_structure

Obl.	Command name	Explanation
	beam_output_file_name	1. Filename incl. relative path to file where the beam data are listed (output) (example ./info/beam.dat)
	body_output_file_name	1. Filename incl. relative path to file where the body data are listed (output) (example ./info/body.dat)
	struct_inertia_output_file_name	1. Filename incl. relative path to file where the global inertia information data are listed (output) (example ./info/inertia.dat)
	body_eigenanalysis_file_name	1. Filename incl. relative path to file where the results of an eigenanalysis are written. (output) (example ./info/eigenfreq.dat)
	constraint_output_file_name	1. Filename incl. relative path to file where the constraint data are listed (output). (example ./info/constraint.dat)
	structure_eigenanalysis_file_name	1. Filename incl. relative path to file where the results of a complete turbine eigenanalysis are listed (example ./info/eigen_all.dat). Animation files of the first modes are placed in same directory as the HAWC2 executable. In the analysis the assumption of rigidly connected bodies in the coupling points are assumed. 2. Optional parameter determining if structural damping is included in the eigenvalue calculation or not. (0=damping not included, most robust method, 1=damping included default)

Sub command block – main_body

This block can be repeated as many times as needed. For every block a new body is added to the structure. A main body is a collection of normal bodies which are grouped together for bookkeeping purposes related to input output. When a main body consist of several bodies the spacing the name of each body inherits the name of the master body and is given an additional name of ‘_#’, where # is the body number. An example could be a main body called ‘blade1’ which consist of two bodies. These are then called ‘blade1_1’ and blade1_2’ internally in the code. The internal names are only important if (output) commands are used that refers to the specific body name and not the main body name.

Obl.	Command name	Explanation
*	name	1. Main_body identification name (must be unique)
*	type	1. Element type used (options are: timoschenko)
*	nbodies	1. Number of bodies the main_body is divided into (especially used for blades when large deformation effects needs attention). Equal number of elements on each body, eventually extra elements are placed on the first body.
*	node_distribution	1. Distribution method of nodes and elements.

Obl.	Command name	Explanation
		Options are: <ul style="list-style-type: none"> • “uniform” nnodes. Where uniform ensures equal element length and nnodes are the node numbers. • “c2_def”, which ensures a node a every station defined with the sub command block c2_def.
	damping	Original damping model that can only be used when the shear center location equals the elastic center to ensure a positive definite damping matrix. It is recommended to use the damping_posdef command instead. Rayleigh damping parameters containing factors that are multiplied to the mass and stiffness matrix respectfully. <ol style="list-style-type: none"> 1. M_x 2. M_y 3. M_z 4. K_x 5. K_y 6. K_z
	damping_posdef	Rayleigh damping parameters containing factors. M_x , M_y , M_z are constants multiplied on the mass matrix diagonal and inserted in the damping matrix. K_x , K_y , K_z are factors multiplied on the moment of inertia I_x , I_y , I_z in the stiffness matrix and inserted in the damping matrix. Parameters are in size approximately the same as the parameters used with the original damping model written above. <ol style="list-style-type: none"> 1. M_x 2. M_y 3. M_z 4. K_x 5. K_y 6. K_z
	copy_main_body	Command that can be used if properties from a previously defined body shall be copied. The name command still have to be present, all other data are overwritten. <ol style="list-style-type: none"> 1. Main_body identification name of main_body that is copied.
	gravity	<ol style="list-style-type: none"> 1. Specification of gravity (directed towards z_G). NB! this gravity command only affects the present main body. Default=9.81 [m/s²]
	concentrated_mass	Concentrated masses and inertias can be attached to the structure. The offset distance as well as the moments and products of inertia is related to the body’s coordinates system. <ol style="list-style-type: none"> 1. Node number to which the inertia is attached. 2. Offset distance x-direction [m] 3. Offset distance y-direction [m] 4. Offset distance z-direction [m] 5. Mass [kg] 6. I_{xx} [kg m²] 7. I_{yy} [kg m²] 8. I_{zz} [kg m²] 9. I_{xy} [kg m²] – optional 10. I_{xz} [kg m²] – optional 11. I_{yz} [kg m²] – optional

Sub sub command block – timoschenko_input

Block containing information about location of the file containing distributed beam property data and the data set requested.

Obl.	Command name	Explanation
*	filename	1. Filename incl. relative path to file where the distributed beam input data are listed (example ./data/hawc2_st.dat)
*	set	1. Set number 2. Sub set number

Sub sub command block – c2_def

In this command block the definition of the centerline of the main_body is described (position of the half chord, when the main_body is a blade). The input data given with the sec commands below is used to define a continuous differentiable line in space using akima spline functions. This centerline is used as basis for local coordinate system definitions for sections along the structure. If two input sections are given it is assumed that all points are on a straight line. If three input sections are given points are assumed to be on the line consisted of two straight lines. If four or more input sections are given points are assumed to be on an akima interpolated spline. This spline will include a straight line if a minimum of three points on this line is defined.

Position and orientation of half chord point related to main body coo.

Figure 2: Illustration of c2_def coordinate system related to main body coordinates.

Obl.	Command name	Explanation
*	nsec	Must be the present before a “sec” command. 1. Number of section commands given below
*	sec	Command that must be repeated “nsec” times. Minimum 4 times. 1. Number 2. x-pos [m] 3. y-pos [m] 4. z-pos [m] 5. θ_z [deg]. Angle between local x-axis and main_body x-axis in the main_body x-y coordinate plane. For a straight blade this angle is the aerodynamic twist. Note that the sign is positive around the z-axis, which is opposite to traditional notation for etc. a pitch angle.

Format definition of file including distributed beam properties

The format of this file which in the old HAWC code was known as the hawc_st file is changed slightly for the HAWC2 new_htc_structure format.

In the file (which is a text file) two different datasets exist. There is a main set and a sub set. The main set is located after a “#” sign followed by the main set number. Within a main there can be as many subsets as desired. They are located after a “\$” sign followed by the local set number. The next sign of the local set number is the number of lines in the following rows that belong to this sub set.

The content of the columns in a data row is specified in the table below. In general all centers are given according to the $C_{1/2}$ center location and all other are related to the principal bending axes.

Position of structural centers related to c2_def section coo.

Figure 3: Illustration of structural properties that in the input files are related to the c2 coordinate system

Table 1 Structural data

Column	Parameter
1	r , curved length distance from main_body node 1 [m]
2	m , mass per unit length [kg/m]
3	x_m, x_{c2} -coordinate from $C_{1/2}$ to mass center [m]
4	y_m, y_{c2} -coordinate from $C_{1/2}$ to mass center [m]
5	r_{ix} , radius of inertia related to elastic center. Corresponds to rotation about principal bending x_e axis [m]
6	r_{iy} , radius of inertia related to elastic center. Corresponds to rotation about principal bending y_e axis [m]
7	x_{ss}, x_{c2} -coordinate from $C_{1/2}$ to shear center [m]
8	y_{ss}, y_{c2} -coordinate from $C_{1/2}$ to shear center [m]
9	E , modulus of elasticity [N/m ²]

10	G, shear modulus of elasticity [N/m²]
11	I_x, area moment of inertia with respect to principal bending x_e axis [m⁴]
12	I_y, area moment of inertia with respect to principal bending y_e axis [m⁴]
13	K, torsional stiffness constant with respect to z_e axis at the shear center [m⁴/rad]. For a circular section only this is identical to the polar moment of inertia.
14	k_x shear factor for force in principal bending x_e direction [-]
15	k_y, shear factor for force in principal bending y_e direction [-]
16	A, cross sectional area [m²]
17	θ_s, structural pitch about z_{c2} axis. This is the angle between the x_{c2} -axis defined with the c2_def command and the 1st main principal bending axis x_e.
18	x_{e2}, x_{c2}-coordinate from C_{1/2} to center of elasticity [m]
19	y_{e2}, y_{c2}-coordinate from C_{1/2} to center of elasticity [m]

An example of an inputfile can be seen on the next page. The most important features to be aware of are colored with **red**.

Sub command - orientation

In this command block the orientation (regarding position and rotation) of every main_body are specified.

Sub sub command - base

The orientation of a main_body to which all other bodies are linked – directly or indirectly.

Obl.	Command name	Explanation
*	mbody (old command name body still usable)	1. Main_body name that is declared to be the base of all bodies (normally the tower or foundation)
*	inipos	Initial position in global coordinates. 1. x-pos [m] 2. y-pos [m] 3. z-pos [m]
♣	mbody_eulerang (old command name body_eulerang still usable)	Command that can be repeated as many times as needed. All following rotation are given as a sequence of euler angle rotations. All angle can be filled in (rotation order x,y,z), but it is recommended only to give a value different from zero on one of the angles and reuse the command if several rotations are needed. 1. θ_x [deg] 2. θ_y [deg] 3. θ_z [deg]
♣	body_eulerpar	The rotation is given as euler parameters (quaternions) directly (global coo). 1. r_0 2. r_1 3. r_2 4. r_3
♣	mbody_axisangle (old command name body_axisangle still usable)	Command that can be repeated as many times as needed. A version of the euler parameters where the input is a rotation vector and the rotation angle of this vector. 1. x-value 2. y-value 3. z-value 4. angle [deg]

♣ One of these commands must be present.

Sub sub command - relative

This command block can be repeated as many times as needed. However the orientation of every main_body should be described.

Obl.	Command name	Explanation
*	mbdy1 (old command name body1 still usable)	<ol style="list-style-type: none"> 1. Main_body name to which the next main_body is attached. 2. Node number of body1 that is used for connection. ("last" can be specified which ensures that the last node on the main_body is used).
*	mbdy2 (old command name body2 still usable)	<ol style="list-style-type: none"> 1. Main_body name of the main_body that is positioned in space by the relative command. 2. Node number of body2 that is used for connection. ("last" can be specified which ensures that the last node on the main_body is used).
♣	mbdy2_eulerang (old command name body2_eulerang still usable)	<p>Command that can be repeated as many times as needed. All following rotation are given as a sequence of euler angle rotations. All angle can be filled in (rotation order x,y,z), but it is recommended only to give a value different from zero on one of the angles and reuse the command if several rotations are needed. Until a rotation command is specified body2 has same coo. as body1. Rotations are performed in the present body2 coo. system.</p> <ol style="list-style-type: none"> 1. θ_x [deg] 2. θ_y [deg] 3. θ_z [deg]
♣	mbdy2_eulerpar (old command name body2_eulerpar still usable)	<p>The rotation is given as euler parameters (quaternions) directly (global coo).</p> <ol style="list-style-type: none"> 1. r_0 2. r_1 3. r_2 4. r_3
♣	mbdy2_axisangle (old command name body2_axisangle still usable)	<p>Command that can be repeated as many times as needed. A version of the euler parameters where the input is a rotation vector and the rotation angle of this vector. Until a rotation command is specified main_body2 has same coo. as main_body1. Rotations are performed in the present main_body2 coo. system.</p> <ol style="list-style-type: none"> 1. x-value 2. y-value 3. z-value 4. angle [deg]
	mbdy2_ini_rotvec_d1 (old command name body2_ini_rotvec_d1 still usable)	<p>Initial rotation velocity of main body and all subsequent attached bodies. A rotation vector is set up and the size of vector (the rotational speed) is given. The coordinate system used is main_body2 coo.</p> <ol style="list-style-type: none"> 1. x-value 2. y-value 3. z-value 4. Vector size (rotational speed [rad/s])

Sub command - constraint

In this block constraints between the main_bodies and to the global coordinate system are defined.

Sub sub command – fix0

This constraint fix node number 1 of a given main_body to ground.

Obl.	Command name	Explanation
*	mbdy (old command name body still usable)	Name of main body that is fixed to ground at node 1

Sub sub command – fix1

This constraint fix a given node on one main_body to another main_body's node.

Obl.	Command name	Explanation
*	mbdy1 (old command name body1 still usable)	<ol style="list-style-type: none">1. Main_body name to which the next main_body is fixed.2. Node number of main_body1 that is used for the constraint. ("last" can be specified which ensures that the last node on the main_body is used).
*	mbdy2 (old command name body2 still usable)	<ol style="list-style-type: none">1. Main_body name of the main_body that is fixed to main_body1.2. Node number of main_body2 that is used for the constraint. ("last" can be specified which ensures that the last node on the main_body is used).

Sub sub command – fix2

This constraint fix a node 1 on a main_body to ground in x,y,z direction. The direction that is free or fixed is optional.

Obl.	Command name	Explanation
*	mbdy (old command name body still usable)	<ol style="list-style-type: none">1. Main_body name to which node 1 is fixed.
*	dof	Direction in global coo that is fixed in translation <ol style="list-style-type: none">1. x-direction (0=free, 1=fixed)2. y-direction (0=free, 1=fixed)3. z-direction (0=free, 1=fixed)

Sub sub command – fix3

This constraint fix a node to ground in tx,ty,tz rotation direction. The rotation direction that is free or fixed is optional.

Obl.	Command name	Explanation
*	mbdy (old command name body still usable)	<ol style="list-style-type: none">1. Main_body name to which node 1 is fixed.2. Node number
*	dof	Direction in global coo that is fixed in rotation <ol style="list-style-type: none">1. tx-rot.direction (0=free, 1=fixed)2. ty-rot.direction (0=free, 1=fixed)3. tz-rot.direction (0=free, 1=fixed)

Sub sub command – fix4

Constraint that locks a node on a body to a another node in translation but not rotation with a prestress feature. The two nodes will start at the defined positions to begin with but narrow the distance until fully attached at time T.

Obl.	Command name	Explanation
*	mbdy1 (old command name body1 still usable)	<ol style="list-style-type: none"> 1. Main_body name to which the next main_body is fixed. 2. Node number of main_body1 that is used for the constraint. (“last” can be specified which ensures that the last node on the main_body is used).
*	mbdy2 (old command name body2 still usable)	<ol style="list-style-type: none"> 1. Main_body name of the main_body that is fixed to body1. 2. Node number of main_body2 that is used for the constraint. (“last” can be specified which ensures that the last node on the main_body is used).
	time	<ol style="list-style-type: none"> 3. Time for the prestress process. Default=2sec

Sub sub command – bearing1

Constraint with properties as a bearing without friction. A sensor with same identification name as the constraint is set up for output purpose.

Obl.	Command name	Explanation
*	name	<ol style="list-style-type: none"> 1. Identification name
*	mbdy1 (old command name body1 still usable)	<ol style="list-style-type: none"> 1. Main_body name to which the next main_body is fixed with bearing1 properties. 2. Node number of main_body1 that is used for the constraint. (“last” can be specified which ensures that the last node on the main_body is used).
*	mbdy2 (old command name body2 still usable)	<ol style="list-style-type: none"> 1. Main_body name of the main_body that is fixed to body1 with bearing1 properties. 2. Node number of main_body2 that is used for the constraint. (“last” can be specified which ensures that the last node on the main_body is used).
*	bearing_vector	<p>Vector to which the free rotation is possible. The direction of this vector also defines the coo to which the output angle is defined.</p> <ol style="list-style-type: none"> 1. Coor. system used for vector definition (0=global,1=mbdy1,2=mbdy2) 2. x-axis 3. y-axis 4. z-axis

Sub sub command – bearing2

This constraint allows a rotation where the angle is directly specified by an external dll action command.

Obl.	Command name	Explanation
*	name	1. Identification name
*	mbdy1 (old command name body1 still usable)	1. Main_body name to which the next main_body is fixed with bearing2 properties. 2. Node number of main_body1 that is used for the constraint. (“last” can be specified which ensures that the last node on the main_body is used).
*	mbdy2 (old command name body2 still usable)	1. Main_body name of the main_body that is fixed to main_body1 with bearing1 properties. 2. Node number of main_body2 that is used for the constraint. (“last” can be specified which ensures that the last node on the main_body is used).
*	bearing_vector	Vector to which the rotation occur. The direction of this vector also defines the coo to which the output angle is defined. 1. Coor. system used for vector definition (0=global,1=mbdy1, 2=mbdy2) 2. x-axis 3. y-axis 4. z-axis

Sub sub command – bearing3

This constraint allows a rotation where the angle velocity is kept constant throughout the simulation.

Obl.	Command name	Explanation
*	name	1. Identification name
*	mbdy1 (old command name body1 still usable)	1. Main_body name to which the next main_body is fixed with bearing3 properties. 2. Node number of main_body1 that is used for the constraint. (“last” can be specified which ensures that the last node on the main_body is used).
*	mbdy2 (old command name body2 still usable)	1. Main_body name of the main_body that is fixed to body1 with bearing3 properties. 2. Node number of main_body2 that is used for the constraint. (“last” can be specified which ensures that the last node on the main_body is used).
*	bearing_vector	Vector to which the rotation occur. The direction of this vector also defines the coo to which the output angle is defined. 1. Coor. system used for vector definition (0=global,1=body1,2=body2) 2. x-axis 3. y-axis 4. z-axis
*	omegas	1. Rotational speed [rad/sec]

Sub sub command – bearing4

This constraint is a cardan shaft constraint. Locked in relative translation. Locked in rotation around one vector and allows rotation about the two other directions.

Obl.	Command name	Explanation
*	name	1. Identification name
*	mbdy1 (old command name body1 still usable)	1. Main_body name to which the next main_body is fixed with bearing3 properties. 2. Node number of main_body1 that is used for the constraint. (“last” can be specified which ensures that the last node on the main_body is used).
*	mbdy2 (old command name body2 still usable)	1. Main_body name of the main_body that is fixed to body1 with bearing3 properties. 2. Node number of main_body2 that is used for the constraint. (“last” can be specified which ensures that the last node on the main_body is used).
*	bearing_vector	Vector to which the rotation is locked. The rotation angle and velocity can be outputted around the two perpendicular directions. 1. Coor. system used for vector definition (0=global,1=mbdy1, 2=mbdy2) 2. x-axis 3. y-axis 4. z-axis

Sub sub command – bearing5

This constraint is a spherical constraint. Locked in relative translation. Free in rotation around all three axis, but only sensor on the main rotation direction.

Obl.	Command name	Explanation
*	name	1. Identification name
*	mbdy1 (old command name body1 still usable)	1. Main_body name to which the next main_body is fixed with bearing3 properties. 2. Node number of main_body1 that is used for the constraint. (“last” can be specified which ensures that the last node on the main_body is used).
*	mbdy2 (old command name body2 still usable)	1. Main_body name of the main_body that is fixed to body1 with bearing3 properties. 2. Node number of main_body2 that is used for the constraint. (“last” can be specified which ensures that the last node on the main_body is used).
*	bearing_vector	Vector to which the rotation is locked. The rotation angle and velocity can be outputted around the two perpendicular directions. 1. Coor. system used for vector definition (0=global,1=mbdy1, 2=mbdy2) 2. x-axis 3. y-axis 4. z-axis

DLL control

This block contains the possible Dynamic Link Library formats accessible for the user. The DLL's are mainly used to control the turbine speed and pitch, but since the DLL format is very general, other use is possible too e.g. external loading of the turbine. Since the HAWC2 core has no information about external stiffness or inertia we have experienced some issues with the solver if the DLL includes high stiffness terms or especially large inertia terms. The new `type2_dll` interface is slightly more stable related to the solver than the `hawc_dll` interface.

Main command block – dll

So far only one DLL format is available, which is the `hawc_dll` format listed below.

Sub command block – hawc_dll

In the `HAWC_DLL` format a subroutine within an externally written DLL is setup. In this subroutine call two one-dimensional arrays are transferred between the HAWC2 core and the DLL procedure. The first contains data going from the HAWC2 core to the DLL and the other contains data going from the DLL to the core. It is very important to notice that the data are transferred between HAWC2 and the DLL in very timestep and every iteration. The user should handle the iteration inside the DLL.

Two more subroutines are called if they are present:

The first is an initialisation call including a text string written in the `init_string` in the commands below. This could be the name of a file holding local input parameters to the data transfer subroutine. This call is only performed once. The name of this subroutine is the same name as the data transfer subroutine defined with the command `dll_subroutine` below with the extra name `'_init'`, hence if the data transfer subroutine is called `'test'`, the initialisation subroutine will be `'test_init'`.

The second subroutine is a message exchange subroutine, where messages written in the DLL can be sent to the HAWC2 core for logfile writing. The name of this subroutine is the same name as the data transfer subroutine defined with the command `dll_subroutine` below with the extra name `'_message'`, hence if the data transfer subroutine is called `'test'`, the initialisation subroutine will be `'test_message'`.

The command block can be repeated as many times as desired. Reference number to DLL is same order as listed, starting with number 1. However it is recommended to refer the DLL using the name feature which in many cases can avoid confusion.

Obl.	Command name	Explanation
	name	1. Reference name of this DLL (to be used with DLL output commands)
*	filename	1. Filename incl. relative path of the DLL (example ./DLL/control.dll)
*	dll_subroutine	1. Name of subroutine in DLL that is addressed (remember to specify the name in the DLL with small letters!)
*	arraysizes	1. size of array with outgoing data 2. size of array with ingoing data
	deltat	1. Time between dll calls. Must correspond to the simulation sample frequency or be a multiple of the time step size. If deltat=0.0 or the deltat command line is omitted the HAWC2 code calls the dll subroutine at every time step.
	init_string	1. Text string (max 256 characters) that will be transferred to the DLL through the subroutine ' <i>subroutine_init</i> '. <i>Subroutine</i> is the name given in in the command dll_subroutine. No blanks can be included.

Sub command block – type2_dll

This dll interface is an updated slightly modified version of the hawc_dll interface. In the TYPE2_DLL format a subroutine within an externally written DLL is setup. In this subroutine call two one-dimensional arrays are transferred between the HAWC2 core and the DLL procedure. The first contains data going from the HAWC2 core to the DLL and the other contains data going from the DLL to the core. It is very important to notice that the data are transferred between HAWC2 and the DLL in the first call of every timestep where the out-going variables are based on last iterated values from previous time step. The sub command **output** and **actions** are identical for both the hawc_dll and the type2_dll interfaces.

In the dll connected with using the type2_dll interface two subroutines should be present. An *initialization* routine called only once before the time simulation begins, and an *update* routine called in every time step. The format in the calling of these two subroutines are identical where two arrays of double precision is exchanged. The subroutine uses the **cdecl** calling convention.

Obl.	Command name	Explanation
	name	1. Reference name of this DLL (to be used with DLL output commands)
*	filename	1. Filename incl. relative path of the DLL (example ./DLL/control.dll)
*	dll_subroutine_init	1. Name of initialization subroutine in DLL that is addressed (remember to specify the name in the DLL with small letters!)
*	dll_subroutine_update	1. Name of subroutine in DLL that is addressed at every time step (remember to specify the name in the DLL with small letters!)
*	arraysizes_init	1. size of array with outgoing data in the initialization call 2. size of array with ingoing data in the initialization

		call
*	arraysizes_update	<ol style="list-style-type: none"> 1. size of array with outgoing data in the update call 2. size of array with ingoing data in the update call
	deltat	<ol style="list-style-type: none"> 1. Time between dll calls. Must correspond to the simulation sample frequency or be a multiple of the time step size. If deltat=0.0 or the deltat command line is omitted the HAWC2 code calls the dll subroutine at every time step.

when using the type2_dll interface the values transferred to the DLL in the initialization phase is done using a sub command block called **init**. The commands for this subcommand block is identical to the **output** subcommand explained below, but only has the option of having the *constant* output sensor available. An example is given for a small dll that is used for converting rotational speed between high speed and low speed side of a gearbox.:

```
begin dll;
  begin type2_dll;
    name hss_convert;
    filename ./control/hss_convert.dll ;
    arraysizes_init 3 1 ;
    arraysizes_update 2 2 ;
    begin init;
      constant 1 2.0 ;      number of used sensors - in this case only 1
      constant 2 35.110;   gearbox ratio
      constant 3 35.110;   gearbox ratio
    end init;
    begin output;
      constraint bearing1 shaft_rot 2 only 2 ;   rotor speed in rpm
      constraint bearing1 shaft_rot 3 only 2 ;   rotor speed in rad/s
    end output;
  ;
  begin actions;
  ;   rotor speed in rpm * gear_ratio
  ;   rotor speed in rad/s * gear_ratio
  end actions;
end type2_dll;
end dll;
```

Sub command block - output

In this block the same block the same sensors are available as when data results are written to a file with the main block command **output**. The order of the sensors in the data array is continuously increased as more sensors are added.

Sub command block - actions

In this command block variables inside the HAWC2 code is changed depending of the specifications. This command block can be used for the hawc_dll interface as well as the type2_dll interface. An action commands creates a handle to the HAWC2 model to which a variable in the input array from the DLL is linked.

!NB in the command name two separate words are present.

Obl.	Command name	Explanation
	aero beta	<p>The flap angle beta is set for a trailing edge flap section (is the mhhmagf stall model is used). The angle is positive towards the pressure side of the profile. Unit is [deg]</p> <ol style="list-style-type: none"> 1. Blade number 2. Flap section number

1 Wind and turbulence

Main command block -wind

Obl.	Command name	Explanation
*	wsp	1. Mean wind speed in center [m/s]
*	density	1. Density of the wind [kg/m ³]
*	tint	1. Turbulence intensity [-].
*	horizontal_input	This command determines whether the commands above should be understood as defined in the global coordinate system (with horizontal axes) or the meteorological coordinates system (u,v,w) witch can be tilted etc. 1. (0=meteorological – default, 1=horizontal)
*	center_pos0	Global coordinates for the center start point of the turbulence box, meteorological coordinate system etc. (default should the hub center) 1. x _G [m] 2. y _G [m] 3. z _G [m]
*	windfield_rotations	Orientation of the wind field. The rotations of the field are performed as a series of 3 rotations in the order yaw, tilt and roll. When all angles are zero the flow direction is identical to the global y direction. 1. Wind yaw angle [deg], positive when the wind comes from the right, seen from the turbine looking in the -y _G direction. 2. Terrain slope angle [deg], positive when the wind comes from below. 3. Roll of wind field [deg], positive when the wind field is rotated according to the turbulence u-component.
*	shear_format	Definition of the mean wind shear 1. Shear type 0=none $\bar{u}(z) = 0$, 1=constant $\bar{u}(z) = c$, 2=logarithmic $\bar{u}(z) = u_0 \frac{\log \frac{-z_0^G + z^M}{r_0}}{\log \frac{-z_0^G}{r_0}}$ 3=power law $\bar{u}(z) = u_0 \frac{(-z_0^G + z^M)^\alpha}{-z_0^G}$ 4=linear $\bar{u}(z) = u_0 \frac{\partial u}{\partial z}$ 2. Parameter used together with shear type (case of shear type: 0=dummy, 1=c, 2=r ₀ , 3= α, 4=du/dz at center)
*	turb_format	1. Turbulence format (0=none, 1=mann, 2=flex)
*	tower_shadow_method	1. Tower shadow model (0=none, 1=potential flow – default, 2=jet model, 3=potential_2 (flow where shadow source is moved and rotated with tower coordinates system))

Obl.	Command name	Explanation
	scale_time_start	1. Starting time for turbulence scaling [s]. Stop time is determined by simulation length.
	wind_ramp_factor	Command that can be repeated as many times as needed. The wind_ramp_factor is used to calculate a factor that is multiplied to the wind speed vectors. Can be used to make troublefree cut-in situations. Linear interpolation is performed between t_0 and t_{stop} . 1. time start, t_0 2. time stop, t_{stop} 3. factor at t_0 4. factor at t_{stop}
	wind_ramp_abs	Command that can be repeated as many times as needed. The wind_ramp_abs is used to calculate a wind speed that is added to the wind speed u-composant. Can be used to make wind steps etc. Linear interpolation is performed between t_0 and t_{stop} . 1. time start, t_0 2. time stop, t_{stop} 3. wind speed at t_0 4. wind speed at t_{stop}
	user_defined_shear	1. Filename incl. relative path to file containing user defined shear factors (example ./data/shear.dat)
	user_defined_shear_turbulence	1. Filename incl. relative path to file containing user defined shear turbulence factors (example ./data/shearturb.dat)
	iec_gust	Gust generator according to IEC 61400-1 1. Gust type ‘eog’ = extreme operating gust $u(z, t) = u(z, t) - 0.37A \sin\left(\frac{3\pi(t-t_0)}{T}\right) \left(1 - \cos\frac{2\pi(t-t_0)}{T}\right)$ ‘edc’ = extreme direction change $\theta(t) = 0.5\varphi_0 \left(1 - \cos\left(\frac{\pi(t-t_0)}{T}\right)\right)$ ‘ecg’ = extreme coherent gust $u(z, t) = u(z, t) + 0.5A \left(1 - \cos\left(\frac{\pi(t-t_0)}{T}\right)\right)$ ‘ecd’ = extreme coherent gust with dir. change $u(z, t) = u(z, t) + 0.5A \left(1 - \cos\left(\frac{\pi(t-t_0)}{T}\right)\right)$ $\theta(t) = 0.5\varphi_0 \left(1 - \cos\left(\frac{\pi(t-t_0)}{T}\right)\right)$ ‘ews’ = extreme wind shear $d = \frac{\sqrt{y_M^2 + z_M^2}}{D}$ $u(z, t) = u(z, t) + \frac{d}{D} A \left(1 - \cos\left(\frac{\pi(t-t_0)}{T}\right)\right) \cos(\arctan 2(y^M, -z^M) - \varphi_0)$ even though the ‘ews’ expressions do not match the expressions in the standard completely, it gives identical results provided a mutual power law shear is used and the A parameter is set to $A = 2.5 + 0.2\beta\sigma_1 \left(\frac{D}{\lambda_1}\right)^{\frac{1}{2}}$ and the parameter φ_0 is set to 0, 90, 180, 270 [deg] respectively. 2. Amplitude A [m/s] 3. Angle φ_0 [deg] 4. Time start, t_0 [m/s] 5. Duration T [m/s]

Sub command block - mann

Block that must be included if the mann turbulence format is chosen. Normal practice is to use all three turbulence components (u,v,w) but only the specified components are used. In 2008 the turbulence generator was linked to the code so mannturbulence can be created without using external software. The command `create_turb_parameters` will search for turbulence files with names given below, but if these are not found the turbulence will be created.

A short explanation of the parameters L and $\alpha\varepsilon^{2/3}$ and its relation to the IEC61400-1 ed. 3 standard is given:

Note by Hans E. Jørgensen, Risø National Laboratory 2005.
The spectra in IEC61400-1 ed. 3 is in inertial subrange described as

$$S_1(f) = 0.4754 \sigma_{iso}^2 \left(\frac{2\pi l}{V_{hub}} \right)^{-2/3} f^{-2/3} \quad (1.1)$$

In jakob's model the spectra are described in wave numbers so

$$S(k_1) = \frac{V}{2\pi} S(f) = 0.4754 \sigma_{iso}^2 l^{-2/3} k_1^{-2/3} \quad (1.2)$$

when we compare Mann's twosided spectra in inertia subrange with (1.2) we have that :

$$\frac{9}{55} \alpha\varepsilon^{2/3} = \frac{0.4754}{2} \sigma_{iso}^2 l^{-2/3} \quad (1.3)$$

$$\alpha\varepsilon^{2/3} = \frac{55}{18} 0.4754 \sigma_{iso}^2 l^{-2/3}$$

The parameter Gamma, which expresses the isotropy of turbulence, is similar to $\gamma=3.9$ in IEC61400-1 ed3

The length scale L corresponds to $0.7-0.8\lambda$ in IEC61400-1 ed3.

However it must be remembered that the $\alpha\varepsilon^{2/3}$ is related to the variance, but this is rescaled internally in the code so the standard deviation in the center of the box matches with the turbulence intensity stated in the main command block `wind`. Small scaling will occur if the $\alpha\varepsilon^{2/3}$ is adjusted properly but due to the rescaling (`dont_scale=0`) the value can be set to 1.0 without affecting the end results.

Obl.	Command name	Explanation
	<code>create_turb_parameters</code>	With this command, the code will search for turbulence files with names given below, but if these are not found the turbulence will be created based on the given parameters. <ol style="list-style-type: none"> 1. Length scale L 2. $\alpha\varepsilon^{2/3}$ 3. γ 4. Seed number (any integer will do) 5. High frequency compensation (1=point velocity only represent local value which is closest to anemometer measurements, recommended in most cases, 0=point velocity represents average velocity in grid volume)
	<code>filename_u</code>	<ol style="list-style-type: none"> 1. Filename incl. relative path to file containing mann turbulence u-composant (example <code>./turb/mann-u.bin</code>)

Obl.	Command name	Explanation
	filename_v	1. Filename incl. relative path to file containing mann turbulence v-composant (example ./turb/mann-v.bin)
	filename_w	1. Filename incl. relative path to file containing mann turbulence w-composant (example ./turb/mann-w.bin)
*	box_dim_u	1. Number of grid points i u-direction 2. Length between grid points in u-direction
*	box_dim_v	1. Number of grid points i v-direction 2. Length between grid points in v-direction
*	box_dim_w	1. Number of grid points i w-direction 2. Length between grid points in w-direction
	std_scaling	Ratio between standard deviation for specified component related to turbulence intensity input specified in main wind command block. 1. Ratio to u-direction (default=1.0) 2. Ratio to v-direction (default=0.8) 3. Ratio to w-direction (default=0.5)
	dont_scale	If this command is used the normal scaling to ensure the specified turbulence intensity is bypassed. 1. (0=scaling according to specified inputs – default, 1=raw turbulence field used without any scaling)

Sub command block - flex

Block that must be included if the mann turbulence format is chosen.

Obl.	Command name	Explanation
*	filename_u	1. Filename incl. relative path to file containing flex turbulence u-composant (example ./turb/flex-u.int)
*	filename_v	1. Filename incl. relative path to file containing flex turbulence v-composant (example ./turb/flex-v.int)
*	filename_w	1. Filename incl. relative path to file containing flex turbulence w-composant (example ./turb/flex-w.int)
	std_scaling	Ratio between standard deviation for specified composant related to turbulence intensity input specified in main wind command block. 1. Ratio to u-direction (default=1.0) 2. Ratio to v-direction (default=0.7) 3. Ratio to w-direction (default=0.5)

File description of user defined shear

In this file a user defined shear used instead, or in combination with one of the default shear types (logarithmic, exponential...). When the user defined shear is used the name and location of the datafile must be specified with the *wind – user_defined_shear* command. This command specifies the location of the file and activates the user defined shear. If this shear is replacing the original default shear the command *wind – shear_format* must be set to zero!

Only one shear can be present in a single file. The shear describes the mean wind profile of the u, v and w component of a vertical cross section at the rotor. The wind speeds are normalized with the mean wind speed defined with the command *wind – wsp*.

Line number	Description
1	Headline (not used by HAWC2)
2	Information of shear v-component. #1 is the number of columns, NC #2 is the number of rows, NR
3	Headline (not used by HAWC2)
4..+NR	Wind speed in v-direction, normalized with u-mean. # NC columns
+1	Headline (not used by HAWC2)
+1..+NR	Wind speed in u-direction, normalized with u-mean. # NC columns.
+1	Headline (not used by HAWC2)
+1..+NR	Wind speed in w-direction, normalized with u-mean. # NC columns
+1	Headline (not used by HAWC2)
+1..+NC	Horizontal position of grid points (meteorological coo)
+1	Headline (not used by HAWC2)
+1..+NR	Vertical position of grid points (meteorological coo)

Example of user defined shear file

```
# User defined shear file
3 5 # nr_v, nr_w      array sizes
# shear_v component, normalized with U_mean

File description of user defined shear turbulence

In this file a set of factors are defined to scale the turbulence as function of vertical and lateral position. When the user defined shear is used, the name and location of the datafile must be specified with the *wind – user_defined_shear_turbulence* command. This command specifies the location of the file and activates the user defined shear.

Only one set of turbulence factors can be present in a single file. The set describes the factors that are multiplied to the turbulence components directly. There are no procedures inside the code to ensure that the actual standard deviation is the same as specified. To be sure of this, the simulation length must fit the length of the turbulence box. The factors in the datafile are still applied even when the *dont_scale* command is activated in the main turbulence block.

Line number	Description
1	Headline (not used by HAWC2)
2	Information of shear #1 is the number of columns, NC #2 is the number of rows, NR
3	Headline (not used by HAWC2)
4..+NR	Scale factors in v-direction # NC columns
+1	Headline (not used by HAWC2)
+1..+NR	Wind speed in u-direction. # NC columns.
+1	Headline (not used by HAWC2)
+1..+NR	Wind speed in w-direction. # NC columns
+1	Headline (not used by HAWC2)
+1..+NC	Horizontal position of grid points (meteorological coo)
+1	Headline (not used by HAWC2)
+1..+NR	Vertical position of grid points (meteorological coo)

Sub command block - wakes

Block that must be included if the Dynamic Wake Meandering model is used to model the wind flow from one or more upstream turbines.

In order to make the model function, two Mann turbulence boxes must be used. One for the meandering turbulence – which is a box containing atmospheric turbulence, but generated with a coarse resolution in the v,w plane (grid size of 1 rotor diameter). It is important that the turbulence vectors at the individual grid points represent a mean value covering a grid cube. It is also important that the total size of the box is large enough to cover the different wake sources including their meandering path. The resolution in the u-direction should be as fine as possible. The used length scale should correspond to normal turbulence condition. The other turbulence box that is needed is a box representing the micro scale turbulence from the wake of the upstream turbine itself. The resolution of this box should be fine (e.g. 128x128 points) in the v,w plane which should only cover 1 rotor diameter. The resolution in the u direction should also be fine, but a short length of the box (e.g. 2.5Diameter) is OK, since the turbulence box is reused. The length scale for this turbulence is significantly shorter than for the other boxes since it represents turbulence from tip and root vortices mainly. A length scale of 1/16 rotor diameter seems appropriate.

The two turbulence boxes are included by the following sub commands

```
begin mann_meanderturb;  
    (parameters are identical to the normal Mann turbulence box, see  
    above)  
end mann_meanderturb;  
  
begin mann_microturb;  
    (parameters are identical to the normal Mann turbulence box, see  
    above)  
end mann_microturb;
```

The rest of the wake commands are given in the following table.

Obl.	Command name	Explanation
*	nsource	1. Number of wake sources. If 0 is used the wake module is by-passed (no source positions can be given in this case).
*	source_pos	Command that must be repeated <i>nsource</i> times. This gives the position of the wake source (hub position) in global coordinates. Wake source position can also be given for down stream turbines. These downstream turbines are however not used in the simulations since they don't affect the target turbine. 1. x-pos [m] 2. y-pos [m] 3. z-pos [m]
*	op_data	Operational conditions for the wake sources. 1. Rotational speed [rad/s] 2. Collective pitch angle [deg]. Defined positive according to the blade root coo, with z-axis from root towards tip.
	ble_parameters	Parameters used for the BLE model used for developing the wake deficit due to turbulent mixing. 1. k_1 [-], default=0.208 2. k_2 [-], default=0.008 3. clean-up parameter (0=intermediate files are kept, 1=intermediate files are deleted), default=1
	microturb_factors	Parameters used for scaling the added wake turbulence according to the deficit depth and depth derivative. 1. k_{m1} [-], factor on deficit depth, default=0.60 2. k_{m2} [-], factor on depth derivative, default=0.25
	tint_meander	Turbulence intensity of the meander turbulence box. If this command is not used then the default turbulence intensity from the general wind commands is used (normal use) 1. Turbulence intensity [-]
	write_ct_cq_file	File including the local axial and tangential forces (non-dim) as function of blade radius is written. 1. Filename incl. path (e.g. ./res/ct_cq.data)
	write_final_deficits	File with the deficits used in the correct downstream distance is written. The windspeed deficits are non-dim with the mean wind speed. 1. Filename incl. path (e.g. ./res/ct_cq.data)

Sub command block – tower_shadow_potential

Block that must be included if the potential flow tower shadow model is chosen.

Obl.	Command name	Explanation
*	tower_offset	The tower shadow has its source at the global coordinate z axis. The offset is the base point for section 1 1. Offset value (default=0.0)
*	nsec	Command that needs to present before the radius commands. 1. Number of datasets specified be the radius command.
*	radius	Command that needs to be listed nsec times. 1. z coordinate [m] 2. Tower radius at z coordinate [m]

Sub command block – tower_shadow_jet

Block that must be included if the model based on the boundary layer equations for a jet is chosen. This model is especially suited for downwind simulations.

Obl.	Command name	Explanation
*	tower_offset	The tower shadow has its source at the global coordinate z axis. The offset is the base point for section 1 1. Offset value (default=0.0)
*	nsec	Command that needs to present before the radius commands. 1. Number of datasets specified by the radius command.
*	radius	Command that needs to be listed nsec times. 1. z coordinate [m] 2. Tower radius at z coordinate [m] 3. C_d drag coefficient of tower section (normally 1.0 for circular section, but this depends heavily on the reynold number)

Sub command block – tower_shadow_potential_2

Block that must be included if the tower shadow method 3 is chosen. This potential model is principally similar to the potential flow model described previously but differs in the way that the shadow source is moved and rotated in space as the tower coordinate system is moving and rotating. It is also possible to define several tower sources e.g. if the tower is a kind of tripod or quattropod. Just include more tower_shadow_potential_2 blocks if more sources are required.

The coordinate the shadow method is linked to is specified by the user, e.g. the mbdy coordinate from the tower main body. To make sure that the tower source model is always linked in the same way as the tower (could be tricky since the tower is fully free to be specified along the x,y or z axis or a combination) the base coordinate system for the shadow model is identical to the coordinates system obtained by the local element coordinates, where the z axis is always pointing from node 1 towards node 2. This is the reason that the tower radius input has to specified with positive z-values, see below.

Obl.	Command name	Explanation
*	tower_mbdy_link	Name of the main body to which the shadow source is linked. 1. mbdy name
*	nsec	Command that needs to present before the radius commands. 1. Number of datasets specified by the radius command.
*	radius	Command that needs to be listed nsec times. 1. z coordinate [m] (allways positive!) 2. Tower radius at z coordinate [m]

Sub command block – tower_shadow_jet_2

Block that must be included if the tower shadow method 4 is chosen. This jet model is principally similar to the jet model described previously but differs in the way that the shadow source is moved and rotated in space as the tower coordinate system is moving and rotating. It is also possible to define several tower sources e.g. if the tower is a kind of tripod or quattropod. Just include more tower_shadow_jet_2 blocks if more sources are required.

The coordinate the shadow method is linked to is specified by the user, e.g. the mbdy coordinate from the tower main body. To make sure that the tower source model is always linked in the same way as the tower (could be tricky since the tower is fully free to be specified along the x,y or z axis or a combination) the base coordinate system for the shadow model is identical to the coordinates system obtained by the local element coordinates, where the z axis is always pointing from node 1 towards node 2. This is the reason that the tower radius input has to specified with positive z-values, see below.

Obl.	Command name	Explanation
*	tower_mbdy_link	Name of the main body to which the shadow source is linked. 1. mbdy name
*	nsec	Command that needs to present before the radius commands. 1. Number of datasets specified by the radius command.
*	radius	Command that needs to be listed nsec times. 1. z coordinate [m] (allways positive!) 2. Tower radius at z coordinate [m]

Sub command block – turb_export

With this sub command block, a mann format turbulence box including information from shear, wakes, tower shadow etc. is written. Same data point positions are used as specified in the turbulence module including the parameters specified for the originally used mann turbulence box.

Obl.	Command name	Explanation
*	filename_u	Filename of turbulence box with axial turbulence 1. File name
*	filename_v	Filename of turbulence box with lateral turbulence 1. File name
*	filename_w	Filename of turbulence box with vertical turbulence 1. File name

Aerodynamics

Main command block - aero

This module set up parameters for the aerodynamic specification of the rotor. It is also possible to submit aerodynamic forces to other structures as example the tower or nacelle, but see chapter (Aerodrag) regarding this.

Obl.	Command name	Explanation
*	nblades	Must be the first line in aero commands! 1. Number of blades
*	hub_vec	Link to main-body vector that points downwind from the rotor under normal conditions. This corresponds to the direction from the pressure side of the rotor towards the suction side where the coordinate system is normally taken from the main shaft system.. 1. mbdy name or 'old_input' if old_htc_structure format is applied. 2. mbdy coo. component (1=x, 2=y, 3=z). If negative the opposite direction used. Not used together with old_htc_structure input (specify a dummy number).
*	link	Linker between structural blades and aerodynamic blades. There must be same number of link commands as nblades! 1. blade number 2. link chooser – options are <ul style="list-style-type: none"> • mbdy_c2_def (used with new structure format) • blade_c2_def (used with old structure format, see description below in this chapter) 3. mbdy name (with new structure format), not used to anything with old structure format.
*	ae_filename	1. Filename incl. relative path to file containing aerodynamic layout data (example ./data/hawc2_ae.dat)
*	pc_filename	1. Filename incl. relative path to file containing profile coefficients (example ./data/hawc2_pc.dat)
*	induction_method	1. Choice between which induction method that shall be used (0=none, 1=normal BEM dynamic induction, 2= Near Wake induction method)
	induction_scale	1. How much will the induction in general be scaled (Default is 1), in both tangential and axial direction.
*	aerocalc_method	2. Choice between which aerodynamic load calculation method that shall be used. (0=none, 1=normal)
*	aerosections	Number of aerodynamic calculation points at a blade. The distribution is performed automatically using a cosinus transformation which gives closest spacing at root and tip. 1. Number of points at each blade.
*	ae_sets	Set number from ae_filename that is linked to blade 1,2,...,nblades 1. set for blade number 1 2. set for blade number 2 . . . nblades. set for blade number nblades
*	tiploss_method	1. Choice between which tip-loss model that shall be used (0=none, 1=prandtl (default))

Obl.	Command name	Explanation
*	dynstall_method	1. Choice between which dynamic stall model that shall be used (0=none, 1=Stig Øye method, 2=MHH Beddoes method, 3=Gaunaa-Andersen method with Deformable Trailing Edge Flap's)

Sub command block – dynstall_so

Block that may be included if the Stig Øye dynamic stall method is chosen. If not included defaults parameters are automatically used.

Obl.	Command name	Explanation
	dcllda	1. Linear slope coefficient for unseparated flow (default=6.28)
	dclldas	1. Linear slope coefficient for fully separated flow (default=3.14)
	alfs	1. Angle of attack [deg] where profile flow is fully separated. (default=40)
	alrund	1. Factor used to generate synthetic separated flow Cl values (default=40)
	taufak	1. Time constant factor in first order filter for F function (default=10.0). Internally used as $\tau = \text{taufak} * \text{chord} * v_{rel}$

Sub command block – dynstall_mhh

Block that may be included if the MHH Beddoes dynamic stall method is chosen. If not included defaults parameters are automatically used.

Obl.	Command name	Explanation
	a1	1. Coefficients of the exponential potential flow step response approximation: $\Phi(s) = 1 - A1 * \exp(-b1 * s) - A2 * \exp(-b2 * s)$. (default= 0.165)
	a2	1. Coefficients of the exponential potential flow step response approximation: $\Phi(s) = 1 - A1 * \exp(-b1 * s) - A2 * \exp(-b2 * s)$. (default= 0.335)
	b1	1. Coefficients of the exponential potential flow step response approximation: $\Phi(s) = 1 - A1 * \exp(-b1 * s) - A2 * \exp(-b2 * s)$. (default= 0.0455)
	b2	1. Coefficients of the exponential potential flow step response approximation: $\Phi(s) = 1 - A1 * \exp(-b1 * s) - A2 * \exp(-b2 * s)$. (default= b2=0.300)
	update	Choice between update methods: 1. 1 (default)=>update aerodynamics all iterations all timesteps; 0=>only update aerodynamics first iteration each new timestep
	taupre	1. Non-dimensional time-lag parameters modeling pressure time-lag. Default value =1.5
	taubly	1. Non-dimensional time-lag parameters modeling boundary layer time-lag. Default value=6.0
	only_potential_model	1. 0(default)=>run full MHH beddoes model; 1=>Potential flow model dynamics superposed to steady force coefficients;

Sub command block – dynstall_mhmagf

Block that may be included if the MHHMAGF Beddoes dynamic stall method is chosen. The stall model is the mhhbeddoes model expanded with dynamic effects of trailing edge flap motion.

Obl.	Command name	Explanation
*	flap	Command that must be repeated for each flap section defined <ol style="list-style-type: none"> 1. Non-dim radius r/R of flap section start, from blade root. 2. Non-dim radius r/R of flap section end, from blade root. 3. Filename incl. relative path to file containing α-delta C_1 static profile coefficients. Fileformat is ASCII – two colums. The delta C_1 marks the delta for one degree positive flap angle at various angles of attack.
	ais	Coefficients of the exponential potential flow step response approximation: <ol style="list-style-type: none"> 1. A1 (default= 0.0821) 2. A2 (default=0.1429) 3. A3 (default=0.3939) Default coefficients is derived for the Risø-B1-18 profile
	bis	Coefficients of the exponential potential flow step response approximation: <ol style="list-style-type: none"> 1. B1 2. B2 3. B3
	ti1	Camberline coefficients <ol style="list-style-type: none"> 1. TI1_a (default=0.01095889075152) 2. TI1_b (default=-0.00097224060418)
	ti2	Camberline coefficients <ol style="list-style-type: none"> 1. TI2_a (default=-0.00105409494045) 2. TI2_b (default=-0.00000964520546) 3. TI2_c (default=0.00011409945431) 4. TI2_d (default=-0.00000096469297)
	ti3	Camberline coefficients <ol style="list-style-type: none"> 1. TI3_a (default=-0.01823405820608) 2. TI3_b (default=-0.00043120871058) 3. TI3_c (default=-0.00042628415385) 4. TI3_d (default=-0.00004009691664)
	ti4	Camberline coefficients <ol style="list-style-type: none"> 1. TI4_a (default=-0.04288996443976) 2. TI4_b (default=-0.00090740475877)

Obl.	Command name	Explanation
	ti9	Camberline coefficients 1. TI9_a (default=-0.02960508187800) 2. TI9_b (default=0.00001446048395) 3. TI9_c (default=-0.00211611339069) 4. TI9_d (default=0.00001171165409)
	hdydx	1. Camberline coef. (default=-0.07106384522900)
	hy	1. Camberline coef. (default=-0.00199404265933)
	fdydxle	1. Camberline coef. (default=0.00619732559359)
	gdydxle	1. Camberline coef. (default=0.00288436419056)
	gyle	1. Camberline coef. (default=0.00006407600471)
	update	Choice between update methods: 1. 1 (default)=>update aerodynamics all iterations all timesteps; 0=>only update aerodynamics first iteration each new timestep
	taupre	1. Non-dimensional time-lag parameters modeling pressure time-lag. Default value =1.5
	taubly	1. Non-dimensional time-lag parameters modeling boundary layer time-lag. Default value=6.0

Camberline coefficients used to specify the dynamics of the flap. These coefficients are given by the Gaunaa model. Default vales used are for the Risø B1-18 profile with a 10% chord length flap mounted.

Sub command block – bemwake_method

Dynamic inflow settings used to calculate the dynamic induction. If not included defaults parameters are automatically used.

Obl.	Command name	Explanation
	nazi	1. Number of azimuthal points in the induction grid. A high number increased accuracy but slow down the simulation time. Default is 16.
	fw	Dynamic time constants and mixing ratio contribution for the far wake part of the induction. 1. Mixing ratio, default is 0.4 2. k3 (poly. coef. for r/R sensitivity) default=0.0 3. k2 (poly. coef. for r/R sensitivity) default=-0.4751 4. k1 (poly. coef. for r/R sensitivity) default=0.4101 5. k0 (poly. coef. for r/R sensitivity) default=1.921
	nw	Dynamic time constants and mixing ratio contribution for the near wake part of the induction. 6. Mixing ratio, default is 0.6 7. k3 (poly. coef. for r/R sensitivity) default=0.0 8. k2 (poly. coef. for r/R sensitivity) default=-0.4783 9. k1 (poly. coef. for r/R sensitivity) default=0.1025 10. k0 (poly. coef. for r/R sensitivity) default=0.6125

0

Data format for the aerodynamic layout

The format of this file which in the old HAWC code was known as the hawc_ae file is changed slightly for the HAWC2 input format. The position of the aerodynamic center is no longer an input value, since the definition is that the center is located in $C_{1/4}$ with calculated velocities in $C_{3/4}$.

Position of aerodynamic centers related to c2_def section coo.

Figure 4: Illustration of aerodynamic centers $c_{1/4}$ and $c_{3/4}$

The format of the file is specified in the following two tables

Line number	Description
1	#1: Nset, Number of datasets present in the file. The format of each data set can be read below. The datasets are repeated without blank lines etc.
2	#1: Set number. #2: Nrows, Number of data rows for this set
3..2+Nrows	Data row according to Table 3

Table 2: Format of main data structure for the aerodynamic blade layout file

The content of the columns in a data row is specified in the table below.

Column	Parameter
1	r, distance from main_body node 1 along z-coordinate [m]
2	chord length [m]
3	thickness ratio between profile height and chord [%]
4	Profile coefficient set number

Table 3 Format of the data rows for the aerodynamic blade layout file

Example of an aerodynamic blade layout file

```

1      Number of datasets in the file.
1 25  Set nr, nrows.
0      2.42  100    1  Radius [m]  chord[m]      thick[%]      PC [-]
1.239  2.42  100    1
1.24   2.42  99.9   1
3.12   2.48  96.4   1
5.24   2.65  80.5   1
7.24   2.81  65.0   1
9.24   2.98  51.6   1
11.24  3.14  40.3   1
13.24  3.17  32.5   1
15.24  2.99  28.4   1
17.24  2.79  25.6   1
19.24  2.58  23.7   1
20.44  2.46  22.8   1
23.24  2.21  20.9   1
25.24  2.06  20.0   1
27.24  1.92  19.4   1
29.24  1.8   19.0   1
31.24  1.68  18.7   1
33.24  1.55  18.6   1
35.24  1.41  18.3   1
37.24  1.18  17.9   1
38.24  0.98  17.3   1
39.24  0.62  16.3   1
39.64  0.48  15.7   1
40.00  0.07  14.8   1

```

Data format for the profile coefficients file

The format of this file which in the old HAWC code was known as the hawc_pc file has not been changed for the HAWC2 code.

The format of the file is specified in the following two tables

Line number	Description
1	#1: Nset, Number of datasets present in the file. The format of each data set can be read below. The datasets are repeated without blank lines etc.
2	#1: Nprofiles. Number of profiles included in the data set.
3	#1: Set number. #2: Nrows. #3: Thickness in percent of chord length
4..3+Nrows	Data row according to Table 5

Table 4: Format of main data structure for the profile coefficients file

The content of the columns in a data row is specified in table below.

Column	Parameter
1	α , angle of attack [deg]. Starting with -180.0, ending with +180.0
2	C_l lift coefficient [-]
3	C_d drag coefficient [-]
4	C_m moment coefficient [-]

Table 5 Format of the data rows for the profile coefficients file

Main command block – blade_c2_def (for use with old_htc_structure format)

In this command block the definition of the centerline of the main_body is described (position of the half chord). This command shall be used as a main command even though it is only used together with the aerodynamic module. The reason for this is that it used to submit information that is usually given in the new_htc_structure format, which is also a main command block. The input data given with the sec commands below is used to define a continuous differentiable line in space using akima spline functions. This centerline is used as basis for local coordinate system definitions for sections along the structure. If a straight line is requested a minimum of three points of this line must be present.

Obl.	Command name	Explanation
*	nsec	Must be the present before a “sec” command. 1. Number of section commands given below
*	sec	Command that must be repeated “nsec” times 1. Number 2. x-pos [m] 3. y-pos [m] 4. z-pos [m] 5. θ_z [deg]. Angle between local x-axis and main_body x-axis in the main_body x-y coordinate plane. For a straight blade this angle is the aerodynamic twist. Note that the sign is positive around the z-axis, which is opposite to traditional notation for etc. a pitch angle.

Aerodrag (for tower and nacelle drag)

Main command aerodrag

With this module it is possible to apply aerodynamic drag forces at a given number of structures.

Subcommand aerodrag_element

Command block that can be repeated as many times as needed. In this command block aerodynamic drag calculation points are set up for a given main body.

Obl.	Command name	Explanation
*	body_name mbdy_name	1. Main_body name to which the hydrodynamic calculation points are linked.
*	aerodrag_sections	1. Distribution method: ("uniform" only possibility) 2. Number of calculation points (min. 2).
	nsec	This command must be present before the sec commands 1. Number of sections given below
	sec	This command must be repeated nsec times 1. Distance along the main_body c2_def line. Positive directed from node 1 to node "last". Internally this distance is normalized with the distance for the last section so calculation points are ensured in the endpoints of the structure. Let the distance of the last point be 1.0 or same length as the main_body to avoid confusion. 2. C _d drag coefficient (default=1.0) 3. Width of structure (diameter)
	update_states	Logical parameter that determines whether the movement of the structure is included or not. 1. parameter (1=states are updated (default), 0=not updated)

*) Input commands that must be present

Hydrodynamics

Main command block - hydro

In this command block hydrodynamic forces calculated using Morisons formula is set up.

Sub command block – water_properties

Obl.	Command name	Explanation
*	gravity	1. Gravity acceleration (used for calculation of buoyancy forces). Default = 9.81 m/s ²
*	mudlevel	1. Mud level [m] in global z coordinates.
*	mwl	1. Mean water level [m] in global z coordinates.
*	rho	1. Density of the water [kg/m ³]. Default=1027
	wave_direction	1. Wave direction [deg]. Direction is positive when the waves come from the right when looking towards the wind at default conditions.
	current	1. Current type (0=none (default), 1=constant, 2=power law $U(z)=U0((z+mudlevel-mwl)/(mudlevel-mwl))^{\text{alfa}}$ 2. Current velocity at mwl, u0 3. type parameter. If type=2 then parameter is alfa 4. Current direction relative to wave direction [deg]. Positive direction if current comes from the right looking towards the incoming waves.
	water_kinematics_dll	1. Filename incl. relative path to file containing water kinematics dll (example ./hydro/water_kin.dll) 2. String sent to initialization of dll. This is typical the name of a local inputfile of the dll.

Sub command block – hydro_element

Command block that can be repeated as many times as needed. This command block set up hydrodynamic calculation points and link them to a main_body.

Obl.	Command name	Explanation
*	body_name mbdy_name	1. Main_body name to which the hydrodynamic calculation points are linked.
*	hydrosections	1. Distribution method of hydrodynamic calculation points. Options are: <ul style="list-style-type: none"> • “uniform” nnodes. Where uniform ensures equal distance of the calculation points. nnodes are number of calculation points. • “auto” nint. Here calculations points are chosen as the positions of the structural nodes and the hydro dynamic input section given by the sec command. The parameter <i>nint</i> is a refinement parameter given <i>nint</i> extra calculation points in between the other points.
*	nsec	This command must be present before the sec commands 1. Number of sections given below

Obl.	Command name	Explanation
*	sec	<p>This command must be repeated nsec times</p> <ol style="list-style-type: none"> 1. Relative distance along the main_body c2_def line. Positive directed from node 1 to node "last". 2. C_m inertia coefficient (default=1.0) 3. C_d drag coefficient (default=1.0) 4. Cross sectional area [m²] 5. Cross sectional area to which C_m is related. (default=area for circular sections) [m²] 6. Width of construction perpendicular to flow direction [m] 7. drdz gradient(optional). For calculating the buoyancy also for conical sections the gradient expressing the change in radius with change of distance along the main_body c2_def line. Only important when buoyancy forces are included. 8. Axial drag C_d coefficient for concentrated force contribution (optional). Drag area is circular area defined by the local width. Contribution is quadratic regarding water velocity. 9. Axial inertia C_m coefficient for concentrated force contribution (optional). Inertia volume is a sphere defined by the local width as diameter. 10. Axial drag C_d coefficient for concentrated force contribution (optional). Drag area is circular area defined by the local width. Contribution is linear regarding water velocity.
	buoyancy	<ol style="list-style-type: none"> 1. Specification whether buoyancy forces are included or not. 0=off (default), 1=on (remember to define the 7th parameter in the sec input line).
	update_states	<ol style="list-style-type: none"> 1. Specification whether the hydrodynamic sections are updated in time with respect to pos,vel,acc and orientations, or simply considered to remain fixed. 0=not updated, 1=updated (default)
	update_kinematics	<ol style="list-style-type: none"> 1. Specification whether the water kinematics are updated during iterations or only once per time step. 0=only updated once per time step, 1=full update (default).

Description of the water_kinematics_dll format.

```

subroutine init(inputfile,t0,t1,dt) implicit none

end subroutine get_kinematics

```

User manual to the standard wkin.dll version 1.3.

The wkin.dll which is delivered along with the HAWC2 code needs a separate inputfile. The format for these inputs are the same as the HAWC2 main inputfile with usage of begin..end clauses, semi colon separators, exit command etc. Command words are described below.

All command words written below has to be included in an begin .. end clause called wkin_input:

```

begin wkin_input;
...
end wkin_input;
exit;

```

Main commands in the wkin.dll:

Obl.	Command name	Explanation
*	wavetype	1. Type of wave used. (0=regular airy, 1=iregular airy, 2=deterministic iregular airy)
*	wdepth	1. Water depth [m]. Positive value.

Sub command *reg_airy*:

Command that need to be present if the wavetype equals 0 in the main command.

Obl.	Command name	Explanation
*	stretching	1. Wheeler stretching of waves. (0=off, 1=on)
*	wave	1. Significant wave height H_s [m] 2. Wave period T [s]

Sub command *ireg_airy*:

Command that need to be present if the wavetype equals 1 in the main command.

Obl.	Command name	Explanation
*	stretching	1. Wheeler stretching of waves. (0=off, 1=on)
*	spectrum	1. Base spectrum used. (1=jonswap)
	jonswap	1. Significant wave height H_s [m] 2. Wave period T_p [s] 3. γ parameter [-]. A typical value is 3.3
*	coef	1. Number of coefficients. Normally 200 is used even though higher values are recommended in general. A speed issue... 2. Seed number. A positive integer value.
	spreading	1. Spreading model. (0=none, 1= K_{2s} model also referred to as K_n model) 2. spreading parameter. If model=1 the parameter is s , a positive integer. The higher value, the less spreading.

Sub command *det_airy*:

Command that need to be present if the wavetype equals 2 in the main command. This command is used when water kinematics needs to be calculated based on a measured elevation time serie.

Obl.	Command name	Explanation
*	file	1. File name for measured wave elevation.
*	nsamples	1. Number of lines present in wave elevation file
*	nskip	1. Number of lines to skip before reading of wave elevation file
*	columns	1. Colum number for time sensor in file. 2. Colum number for wave elevation in file.
	stretching	1. Wheeler stretching of waves. (0=off, 1=on (default))
	cutoff_frac	1. Fraction of total energy which is dicarded in the low and high frequency ranges. Default 1E-5

Wkin.dll example file

```

begin wkin_input ;
  wavetype 1 ;      0=regular, 1=irregular, 2=deterministic
  wdepth 220.0 ;
;
  begin reg_airy ;
    stretching 0;    0=none, 1=wheeler
    wave 9 12.6;    Hs,T
  end;
;
  begin ireg_airy ;
    stretching 0;    0=none, 1=wheeler
    spectrum 1;      (1=jonswap)
    jonswap 9 12.6 3.3 ; (Hs, Tp, gamma)
    coef 200 1 ;     (coefnr, seed)
    spreading 1 2;   (type(0=off 1=on), s parameter (pos. integer min 1)
  end;
;
  begin det_airy ;
    stretching 0;    0=none, 1=wheeler
    file ..\waves\elevation.dat ;
    nsamples 32768 ;
    nskip 1 ;
    columns 1 5 ;    time column, elevation column
  end;
;
end;
;
exit ;

```

Soil module

Main command block - soil

In this command block soil spring/damper forces can be attached to a main body. The formulation is performed so it can be used for other external distributed spring/damper systems than soil.

Sub command block – soil_element

Command block that can be repeated as many times as needed. In this command block the distributed soil spring/damper system is set up for a given main body.

Obl.	Command name	Explanation
*	body_name	1. Main_body name to which the soil calculation points are linked.
*	datafile	1. Filename incl. relative path to file containing soil spring properties (example ./soil/soildata.dat)
*	soilsections	1. Distribution method: (“uniform” only possibility) 2. Number of section (min. 2).
	damping_k_factor	1. Rayleigh kind of damping. Factor the linear stiffness coefficients are multiplied with to obtain the damping coefficients. When the factor is 1.0 the vibration is critically damped for the rigid mainbody connected to the spring and dampers.
♣	set	1. Set number in datafile that is used.

*) Input commands that must be present

♣) Command can be repeated as many times as desired.

Data format of the soil spring datafile

In the file (which is a text file) different distributed springs can be defined. Each set is located after the “#” sign followed by the set number. Within a set the following data needs to be present.

line 1	“spring type”	(can be “axial”, “lateral” or “rotation_z”)
line 2:	“nrow ndefl”	(nrow is number of rows, ndefl is number of deflections (columns))
line 3..3+nrow	“z_global F(1) F(2),..., F(ndefl)”	First colum is the spring location (global z coordinate). The following colums are Force/length at the different deflection stations. First deflection must be zero. The forces are assumed symmetrical around the zero deflection.

An example is given below:

```
This is a nonlinear soil spring demonstration file
#1
lateral                (axial/lateral)
5 4                    nrow ndefl
0.0 0.0 0.1 0.2 1.0 x1 x2 x3 ..... [m]
10.0 0 15 20 500 Z_G F_1 F_2 F_3 .... F_ndefl [kN/m]
20.0 0 15 20 500
30.0 0 15 20 500
40.0 0 15 20 500
#2
axial                  (axial/lateral)
5 4                    nrow ndefl
0.0 0.0 0.1 0.2 1.0 x1 x2 x3 ..... [m]
10.0 0 150 200 5000 Z_G F_1 F_2 F_3 .... F_ndefl [kN/m]
20.0 0 150 200 5000
30.0 0 150 200 5000
40.0 0 150 200 5000
#3
rotation_z            (axial/lateral/rotation_z)
5 4                    nrow ndefl
0.0 0.0 0.1 0.2 1.0 x1 x2 x3 ..... [rad]
10.0 0 150 200 5000 Z_G M_1 M_2 M_3 .... M_ndefl [kNm/m]
20.0 0 150 200 5000
30.0 0 150 200 5000
40.0 0 150 200 5000
```

External forces through DLL

Main command block – Force

Sub command - DLL

This command block can be used when a user defined external force is applied to the structure. The main difference between this DLL format and the normal DLL control interface (used with external controllers) is that added stiffness is calculated initially leading to a more robust a fast solution of the coupled system. This force module can with good results be applied for external equivalent soil-springs or hydrodynamic forces for floating constructions or mooring lines.

Obl.	Command name	Explanation and parameters
	dll	1. Filename incl. relative path to the external DLL (example ./dll/force.dll)
	update	1. Name of subroutine in the DLL.
	mbdy	1. Name of main body to which force dll is coupled.
	node	1. Node number of main body to which force dll is couple

Example of a DLL interface written in fortran90

```

!
! Demonstration of force DLL
!
SUBROUTINE DemoForceDLL(time,x,xdot,xdot2,amat,omega,omegadot,F,M)
!DEC$ ATTRIBUTES DLLEXPORT::DemoForceDLL
!DEC$ ATTRIBUTES ALIAS:'demoforcedll' :: DemoForceDLL
! input
DOUBLE PRECISION          :: time      ! time

F = mass*((/0.d0,0.d0,9.81d0/) - xdot2)
M = 0.d0
!
END SUBROUTINE DemoForceDLL

```

Output

This command **output** can either be a main command block or a sub command block within the `hawc_dll` command block. In the tables below two special columns are introduced. One is *only option* and the other *label option*. When the check mark is 'yes' in *only option* it is possible to use only one of the fields if more than one sensor was defined through the command. The sensor that is used is determined by the number following the *only* command word, see example below.

```
constraint bearing1 shaft_rot 2 only 2;
```

If the *only* command (and the following number) was omitted two sensors was defined; one for the angle and one for the velocity. With the *only* command only the velocity sensor is used in the output since the following number is 2.

With the label option it is possible to make a user defined label of the sensor which is written in the sensor list file. The label command is the # symbol. Everything after the # symbol is used as a label. An example of this could be

```
dll invec 1 1 # This is a dummy label ;
```

Commands used with results file writing

When the output command is used for output files (the most normal purpose) some information regarding file name and format needs to be give

Obl	Command	Explanation
*	filename	1. Filename incl. relative path to outputfile without extension (example <code>./res/output</code>)
	data_format	ASCII or compressed binary output can be chosen. Default is the ASCII format if nothing is specified. 1. format ('hawc_ascii'=ASCII format, 'hawc_binary'=compressed binary format, 'flex_binary'=compressed binary format)
	buffer	Buffer size in terms of time steps. When the buffer is full the data are written to data file. Only used together with the ASCII format. 1. buffer size
	time	Time start t_0 and stop t_1 for output is defined. Default is the entire simulation length if nothing is specified. 1. t_0 2. t_1

File format of HAWC_ASCII files

Results are written to an ascii formatted data file with the name assigned to the filename variable (eg. filename ./res/resfil). The data file will have the extension .dat as a standard. The description of the sensors in the data file is given in another textfile with same filename as the data file but the extension .sel. An example could be: ./res/resfil.dat and ./res/resfil.sel.

In the .sel-file, line numer 9 specifies the following parameters: Number of scans, Number of sensors, Duration of output file, Data format (ASCII/BINARY). Example:

```
10 96 20.000 ASCII
```

From line number 13 and onwards, the sensors are specified with the following information:

Sensor number, Variable description, unit, Long description. Example:

```
5      beal angle_speed          rad/s      pitch1 angle speed
```

Full example of the .sel file:

```
Version ID : HAWC2MB 4.3w
```

Time : 14:23:28
Date : 22:11.2006

```
Result file : ./res2_rev0/case41c_nohydro.dat
```

Scans	Channels	Time [sec]	Format
4500	199	90.000	ASCII

Channel	Variable	Description	Unit	Long Description
1	Time		s	Time
2	beal angle		deg	shaft_rot angle
3	beal angle_speed		rpm	shaft_rot angle speed
4	beal angle		deg	pitch1 angle
5	beal angle_speed		rad/s	pitch1 angle speed
6	beal angle		deg	pitch2 angle
7	beal angle_speed		rad/s	pitch2 angle speed
8	beal angle		deg	pitch3 angle
9	beal angle_speed		rad/s	pitch3 angle speed

File format of HAWC_BINARY files

In this file format results are written to a binary unformatted data file with the name assigned to the filename variable (eg. filename ./res/resfil). The data file will have the extension .dat as a standard. The description of the sensors in the data file is given in another textfile with same filename as the data file but the extension .sel. An example could be: ./res/resfil.dat and ./res/resfil.sel.

The data are scaled to standard 2-byte integers, with a range of 32000 using a scalefactor. The scalefactor is determined for each output sensor

$$s = \frac{MAX(abs(max), abs(min))}{32000}$$

where *max* and *min* are the largest and lowest number in the original data for the sensor. These scale factors are written in the end of the accompanying .sel file. When

converting a binary number to the actual number its just a matter of multiplying the binary numbers of a sensor with the corresponding scalefactor.

In the accompanying text file, which has the extension .sel-file, information of the content in the datafile is stored. In line number 9 the following parameters are specified: Number of scans, Number of sensors, Duration of output file, Data format (ASCII/BINARY). Example:

```
10 96 20.000 ASCII
```

From line number 13 and onwards, the sensors are specified with the following information:

Sensor number, Variable description, unit, Long description. Example:

```
5      beal angle_speed          rad/s      pitch1 angle speed
```

From line number 9+nsensors+5 and upwards the scalefactors are written.

Full example of the .sel file:

```

-----
Version ID : HAWC2MB 4.3
                                                    Time : 14:23:28
                                                    Date  : 22:11.2006
-----
Result file : ./res2_rev0/case41c_nohydro.dat
-----
Scans   Channels   Time [sec]   Format
 4500         9       90.000     ASCII

Channel  Variable Description
-----
 1      Time                s              Time
 2      beal angle          deg            shaft_rot angle
 3      beal angle_speed    rpm            shaft_rot angle speed
 4      beal angle          deg            pitch1 angle
 5      beal angle_speed    rad/s         pitch1 angle speed
 6      beal angle          deg            pitch2 angle
 7      beal angle_speed    rad/s         pitch2 angle speed
 8      beal angle          deg            pitch3 angle
 9      beal angle_speed    rad/s         pitch3 angle speed
-----
Scale factors:
 1.56250E-04
 5.61731E-03
 4.41991E-04
 1.00000E+00
 1.00000E+00
 1.00000E+00
 1.00000E+00
 1.00000E+00
 1.00000E+00
 1.00000E+00

```

An important thing to notice is that in the binary data file all sensors are stored sequentially, i.e. all data for sensor 1, all data for sensor 2, etc. This way of storing the data makes later reading of a sensor extra fast since all data for a sensor can be read without reading any data for the other sensor.

A small matlab code for reading the binary HAWC2 format can be seen below.

```
function sig = ReadHawc2Bin(FileName,path);
% Reads binary HAWC2 results file
% -----
% [t,sig] = ReadFlex4(FileName,Ch);
% filename should be without extension
% -----
% BSKA 26/2-2008
% -----
ThisPath = pwd; cd(path(1,:))

% reading scale factors from *.sel file
fid = fopen([FileName,'.sel'], 'r'); fgets(fid); fgets(fid);
fgets(fid); fgets(fid); fgets(fid); fgets(fid); fgets(fid);
fgets(fid);
tline = fscanf(fid,'%d');
N = tline(1); Nch = tline(2); Time = tline(3); fclose(fid);
ScaleFactor = dlmread([FileName,'.sel'],'',[9+Nch+5 0 9+2*Nch+4
0]);

% reading binary data file
fid = fopen([FileName,'.dat'], 'r'); sig =
fread(fid,[N,Nch],'int16')*diag(ScaleFactor); fclose(fid);

cd(ThisPath)
```

mbdy (main body related commands)

Command 1	Command 2	Explanation	Only option	Label option
mbdy	forcevec	<p>F_x, F_y, F_z shear force vector defined to output.</p> <ol style="list-style-type: none"> 1. Main_body name 2. Element number 3. Node number on element 4. bearing1

Command 1	Command 2	Explanation	Only option	Label option
constraint	bearing1	<p>Bearing angle and angle velocity defined to output</p> <ol style="list-style-type: none"> 1. bearing1 name 2. unit of output <p>(1:angle [unit=rad, range $-\pi:\pi$], vel [rad/s]; 2:angle [unit=deg, range 0:360], vel [rpm]; 3:angle [unit=deg, range 0:360], vel [rad/s]); 4:angle [unit=deg, range -180:180], vel [rad/s]; 5:angle [unit=deg, range -180:180], vel [deg/s])</p>	Yes	No

bearing2

Command 1	Command 2	Explanation	Only option	Label option
constraint	bearing2	<p>Bearing angle and angle velocity defined to output</p> <ol style="list-style-type: none"> 1. bearing1 name 2. unit of output <p>(1:angle [unit=rad, range $-\pi:\pi$], vel [rad/s]; 2:angle [unit=deg, range 0:360], vel [rpm]; 3:angle [unit=deg, range 0:360], vel [rad/s]); 4:angle [unit=deg, range -180:180], vel [rad/s]; 5:angle [unit=deg, range -180:180], vel [deg/s])</p>	Yes	No

bearing3

Command 1	Command 2	Explanation	Only option	Label option
constraint	bearing3	Bearing angle and angle velocity defined to output 1. bearing1 name 2. unit of output (1:angle [unit=rad, range $-\pi:\pi$], vel [rad/s]; 2:angle [unit=deg, range 0:360], vel [rpm]; 3:angle [unit=deg, range 0:360], vel [rad/s]; 4:angle [unit=deg, range -180:180], vel [rad/s]; 5:angle [unit=deg, range -180:180], vel [deg/s])	Yes	No

bearing4

Rotation angle and velocity of the two axis perpendicular to the cardan shaft torsion axis are outputted.

Command 1	Command 2	Explanation	Only option	Label option
constraint	bearing4	Bearing angle and angle velocity defined to output 1. bearing1 name 2. unit of output (1:angle [unit=rad, range $-\pi:\pi$], vel [rad/s]; 2:angle [unit=deg, range 0:360], vel [rpm]; 3:angle [unit=deg, range 0:360], vel [rad/s]; 4:angle [unit=deg, range -180:180], vel [rad/s]; 5:angle [unit=deg, range -180:180], vel [deg/s])	Yes	No

body (old body related commands)

These commands are still part of the code but should be seen as obsolete since they refer to an internal body naming insted of the main_body names. Please refer to the *mbdy* output commands.

Command 1	Command 2	Explanation	Label option
body	forcevec	F_x, F_y, F_z shear force vector defined to output. Unit [kN] <ol style="list-style-type: none"> body number Element number Node number on element coordinate system (1=body, 2=global, 3=element) 	No
body	momentvec	M_x, M_y, M_z moment vector defined to output. Unit [kNm] <ol style="list-style-type: none"> body number Element number Node number on element coordinate system (1=body, 2=global, 3=element) 	No
body	node_defl	x,y,z deflection vector (within a body) defined to output. Unit [m] <ol style="list-style-type: none"> body number Element number Node number on element coordinate system (1=body, 2=global, 3=element) 	No
body	node_rot	$\theta_x, \theta_y, \theta_z$ rotations (within a body) define to output. Unit [rad] <ol style="list-style-type: none"> body number Element number Node number on element coordinate system (1=body, 2=global, 3=element) 	No
body	pitchangle	Pitchangle of pitch bearing defined with the old_htc_structure is defined to output. <ol style="list-style-type: none"> Unit (1=[rad], 2=[deg]) Pitch bearing number 	No
body	pitchspeed	Pitch velocity of pitch bearing defined with the old_htc_structure is defined to output. <ol style="list-style-type: none"> Unit (1=[rad/s], 2=[deg/s]) Pitch bearing number 	No
body	node_state	State vector (position, velocity or accelertion) of a given on an element is defined to output. <ol style="list-style-type: none"> state (“pos”=position, “vel”=velocity, “acc”=acceleration) body name element number z_{rel} (distance between node 1 and 2 divided by element length) coordinate system (1=global) 	No

aero (aerodynamic related commands)

Command 1	Command 2	Explanation	Label option
aero	time	Simulation time to output. No parameters.	No
aero	azimuth	Azimuth angle of selected blade. Zero is vertical downwards. Positive clockwise around blade root y-axis. Unit [deg] 1. Blade number	No
aero	omega	Rotational speed of rotor. Unit [rad/s]	No
aero	vrel	Relative velocity in x-y local aerodynamic plane. Unit [m/s] 1. Blade number 2. Radius [m] (nearest inner calculation point is used)	No
aero	alfa	Angle of attack in x-y local aerodynamic plane. Unit [deg] 1. Blade number 2. Radius [m] (nearest inner calculation point is used)	No
aero	beta	Flap deflection angle in x-y local aerodynamic plane. Unit [deg] 3. Blade number 4. Flap number as specified in the dynstall_mhmagf section starting with 1	No
aero	cl	Instantaneous lift coefficient. Unit [-] 1. Blade number 2. Radius [m] (nearest inner calculation point is used)	No
aero	cd	Instantaneous drag coefficient. Unit [-] 1. Blade number 2. Radius [m] (nearest inner calculation point is used)	No
aero	cm	Instantaneous moment coefficient. Unit [-] 1. Blade number 2. Radius [m] (nearest inner calculation point is used)	No
aero	lift	Lift force at calculation point. Unit [kN/m] 1. Blade number 2. Radius [m] (nearest inner calculation point is used)	No
aero	drag	Drag force at calculation point. Unit [kN/m] 1. Blade number 2. Radius [m] (nearest inner calculation point is used)	No
aero	moment	Aerodynamic moment at calculation point. Unit [kNm/m] 1. Blade number 2. Radius [m] (nearest inner calculation point is used)	No
aero	secforce	Aerodynamic force at calculation point. Local aero coo. Unit [kN/m] 1. Blade number 2. Dof number (1= F_x , 2= F_y , 3= F_z) 3. Radius [m] (nearest inner calculation point is used)	No

Command 1	Command 2	Explanation	Label option
aero	secmoment	Aerodynamic moment at calculation point. Local aero coo. Unit [kN/m] <ol style="list-style-type: none"> 1. Blade number 2. Dof number (1=M_x, 2=M_y, 3=M_z) 3. Radius [m] (nearest inner calculation point is used) 	No
aero	int_force	Integrated aerodynamic forces from tip to calculational point. NB the integration is performed around the $C_{3/4}$ location. Unit [kN] <ol style="list-style-type: none"> 1. Coordinates system (1=local aero coo, 2=blade ref. system, 3=global, 4=rotor polar) 2. Blade number 3. Dof number (1=M_x, 2=M_y, 3=M_z) 4. Radius [m] (nearest inner calculation point is used) 	No
aero	int_moment	Integrated aerodynamic moment from tip to calculational point. NB the integration is performed around the $C_{3/4}$ location. Unit [kN] <ol style="list-style-type: none"> 1. Coordinates system (1=local aero coo, 2=blade ref. system, 3=global, 4=rotor polar) 2. Blade number 3. Dof number (1=M_x, 2=M_y, 3=M_z) 4. Radius [m] (nearest inner calculation point is used) 	No
aero	torque	Integrated aerodynamic forces of all blades to rotor torsion. Unit [kNm]. No parameters	No
aero	thrust	Integrated aerodynamic forces of all blades to rotor thrust. Unit [kN]. No parameters	No
aero	position	Position of calculation point. Unit [m]. <ol style="list-style-type: none"> 1. Coordinates system (1=local aero coo, 2=blade ref. system, 3=global, 4=rotor polar) 2. Blade number 3. Dof number (1=M_x, 2=M_y, 3=M_z) 4. Radius [m] (nearest inner calculation point is used) 	No
aero	rotation	Orientation of calculation point. Unit [deg]. <ol style="list-style-type: none"> 1. Blade number 2. Dof number (1=θ_x, 2=θ_y, 3=θ_z) 3. Radius [m] (nearest inner calculation point is used) 4. Coordinates system (1=blade_ref. coo, 2=rotor polar coo.) 	No
aero	velocity	Velocity of calculation point. Unit [m/s]. <ol style="list-style-type: none"> 1. Coordinates system (1=local aero coo, 2=blade ref. system, 3=global, 4=rotor polar) 2. Blade number 3. Dof number (1=V_x, 2=V_y, 3=V_z) 4. Radius [m] (nearest inner calculation point is used) 	No

Command 1	Command 2	Explanation	Label option
aero	acceleration	Acceleration of calculation point. Unit [m/s ²]. <ol style="list-style-type: none"> Coordinates system (1=local aero coo, 2=blade ref. system, 3=global, 4=rotor polar) Blade number Dof number (1= V_x, 2=V_y, 3=V_z) Radius [m] (nearest inner calculation point is used) 	No
aero	windspeed	Free wind speed seen from the blade. Unit [m/s] <ol style="list-style-type: none"> Coordinates system (1=local aero coo, 2=blade ref. system, 3=global, 4=rotor polar) Blade number Dof number (1= V_x, 2=V_y, 3=V_z) Radius [m] (nearest inner calculation point is used) 	No
aero	induc	Local induced velocity at calculation point. Unit [m/s] <ol style="list-style-type: none"> Coordinates system (1=local aero coo, 2=blade ref. system, 3=global, 4=rotor polar) Blade number Dof number (1= V_x, 2=V_y, 3=V_z) Radius [m] (nearest inner calculation point is used) 	No
aero	induc_sector_ct	Thrust coefficient at a position on the rotor. Unit [-] <ol style="list-style-type: none"> Radius [m/s] Azimuth angle (zero downwards) [deg] 	No
aero	induc_sector_cq	Torque coefficient at a position on the rotor. Unit [-] <ol style="list-style-type: none"> Radius [m/s] Azimuth angle (zero downwards) [deg] 	No
aero	induc_sector_a	Axial induction coefficient at a position on the rotor. Unit [-] <ol style="list-style-type: none"> Radius [m/s] Azimuth angle (zero downwards) [deg] 	No
aero	induc_sector_am	Tangential induction coefficient at a position on the rotor. Unit [-] <ol style="list-style-type: none"> Radius [m/s] Azimuth angle (zero downwards) [deg] 	No
aero	induc_a_norm	Axial velocity used in normalization expression of rotor thrust coefficients. The average axial wind velocity incl. induction. Unit [m/s]. No parameters.	No
aero	induc_am_norm	Tangential velocity used in normalization expression of torque coefficient. Average tangential velocity at a given radius. Unit [m/s]. <ol style="list-style-type: none"> Radius [m] 	No

Command 1	Command 2	Explanation	Label option
aero	inflow_angle	Angle of attack + rotation angle of profile related to polar coordinates (not pitching). Unit [deg] 1. Blade number 2. Radius [m] (nearest inner calculation point is used)	No
aero	dclalpha	Gradient $dCl/d\alpha$. Unit [deg ⁻¹] 1. Blade number 2. Radius [m] (nearest inner calculation point is used)	No
aero	dcddalpha	Gradient $dCd/d\alpha$. Unit [deg ⁻¹] 1. Blade number 2. Radius [m] (nearest inner calculation point is used)	No
aero	gamma	Circulation strength at calculation point. Unit [m ² /s] 1. Blade number 2. Radius [m] (nearest inner calculation point is used)	No
aero	kfw	BEM Dynamic Induction scaling factor, as default kfw=number of blades (eg.3), but when running the Near Wake model the far wake has to be scaled, kfw is the scaling coefficient usually around 2.7. Unit []	No
aero	lambda	Tip speed ratio, Unit []	No
aero	windspeed_boom	Free wind speed seen by a boom mounted on a blade section. Coordinate system used “blade ref. system”. Unit [m/s]. 1. Blade number 2. Radius [m] (nearest inner calculation point is used) 3. Boom-length X, measured from half chord point positive towards LE [m] 4. Boom-length Y, measured from half chord point positive towards pressureside [m]	No
aero	actuatorendiskload	Actuator disk load provide normalized load export for the Actuator Disk Model. 1. DOF (1=Ft, 2=Fa, 3=Fr) 2. Radius [m] (nearest inner calculation point is used)	No

Illustration of the boom coordinates used by the “windspeed_boom” command.

wind (wind related commands)

Command 1	Command 2	Explanation	Only option	Label option
wind	free_wind	Wind vector V_x , V_y , V_z (wind as if the turbine didn't exist). <ol style="list-style-type: none"> Coordinate system (1=global, 2=non rotating rotor coordinates (x always horizontal, y always out-of-plane)) x-pos (global coo) y-pos (global coo) z-pos (global coo) 	Yes	No
wind	free_wind_hor	Horizontal wind component velocity [m/s] and direction [deg] defined to output. Dir=0 when wind equals y-dir. <ol style="list-style-type: none"> Coordinate system (1=global, 2=non rotating rotor coordinates (x always horizontal, y always out-of-plane)) x-pos (global coo) y-pos (global coo) z-pos (global coo) 	Yes	No

wind_wake (wind wake related commands)

Command 1	Command 2	Explanation	Only option	Label option
wind_wake	wake_pos	Position of the wake deficit center after the meandering proces to the downstream end position. x,y and z position is written in meteorological coordinates $(x,y,z)_M=(u,v,w)$ with origo in the position defined with center_pos0 in the general wind commands. <ol style="list-style-type: none"> wake source number 	Yes	No

dll (DLL related commands)

Command 1	Command 2	Explanation	Label option
dll	invec	Value from DLL input vector is defined to output <ol style="list-style-type: none"> DLL number array index number 	yes
dll	outvec	Value from DLL output vector is defined to output <ol style="list-style-type: none"> DLL number array index number 	yes

hydro (hydrodynamic related commands)

Command 1	Command 2	Explanation	Only option	Label option
hydro	water_surface	Water surface level at a given horizontal location is defined to output (global coordinates). Unit [m] <ol style="list-style-type: none"> x-pos y-pos 	No	No
hydro	water_vel_acc	Water velocity V_x , V_y , V_z , and acceleration A_x , A_y , A_z vectors defined to output. Unit [m/s] and [m/s ²]. <ol style="list-style-type: none"> x-pos y-pos z-pos 	Yes	No
hydro	fm	Inertia force F_x , F_y , F_z contribution from Morisons formula in a given calculation point. Unit [kN] <ol style="list-style-type: none"> hydro element number sec number coordinate system (1=global) 	Yes	No
hydro	fd	Drag force F_x , F_y , F_z contribution from Morisons formula in a given calculation point. Unit [kN] <ol style="list-style-type: none"> hydro element number sec number coordinate system (1=global) 	Yes	No

general (general output commands)

Command 1	Command 2	Explanation	Label option
general	constant	A constant value is send to output 1. constant value	No
general	step	A step function is created. This function changes from f_0 to f_1 at time t_0 . 1. t_0 [sec] 2. f_0 3. f_1	No
general	time	The time is send to output. No parameters	No
general	deltat	The time increment is send to output. No parameters	No
general	harmonic	A harmonic function is send to output $F(t) = A \sin(2\pi f_0 t) + k$ 1. A 2. f_0 3. k	No
general	harmonic2	A harmonic function is send to output $F(t) = \begin{cases} 0 & t < t_0 \\ A \sin(2\pi f_0 (t - t_0)) + k & t_0 \leq t \leq t_1 \\ 0 & t > t_1 \end{cases}$ 1. A 2. f_0 3. k 4. t_0 5. t_1	No
general	stairs	A series of steps resulting in a staircase signal is created. 1. f_0 start value of function 2. t_0 time for first step change [s] 3. Step size 4. Step duration [s] 5. Number of steps	No
general	status	A status flag (mainly for controller purpose) is written. A first time step and first iteration the output value is 0. During the rest of the simulation the value is 1 until last time step where the value is -1.	No

Output_at_time (output at a given time)

This command is especially usefull if a snapshot of loads or other properties are required at a specific time. This is mostly used for writing calculated aerodynamic properties as function of blade location. The command block can be repeated as many times as needed (e.g. if outputs at more than one time is needed)

The command must be written with the following syntax

`output_at_time keyword time`

where *keyword* is a command listed in the subsections below. Sofar only the command `aero` is present. The last command word *time* is the time in seconds from simulation start to which the output are written.

aero (aerodynamic output commands)

The first line in the output_at block must be the information regarding which file the outputs are written (the filename command listed in the table below)

Command 1	Explanation	Label option
filename	Filename incl. relative path to output file (example ./output/output_at.dat). 1. filename	No
alfa	Angle of attack [deg]. 1. Blade number	No
vrel	Relative velocity [m/s] 1. Blade number	No
cl	Lift coefficient [-] 1. Blade number	No
cd	Drag coefficient [-] 1. Blade number	No
cm	Moment coefficient [-] 1. Blade number	No
lift	Lift force L [N] 1. Blade number	No
drag	Drag force D [N] 1. Blade number	No
moment	Moment force M [Nm] 1. Blade number	No
secforce	Aerodynamic forces [N] 1. Blade number 2. DOF number (1=x,2=y,3=z) 3. Coordinate system (1=aero, 2=blade, 3=global, 4=rotor polar)	No
secmoment	Aerodynamic moments [Nm] 1. Blade number 2. DOF number (1=x,2=y,3=z) 3. Coordinate system (1=aero, 2=blade, 3=global, 4=rotor polar)	No
int_force	Aerodynamic forces integrated from tip to given radius [N] 1. Blade number 2. DOF number (1=x,2=y,3=z) 3. Coordinate system (1=aero, 2=blade, 3=global, 4=rotor polar)	No
int_moment	Aerodynamic moment integrated from tip to given radius [N] 1. Blade number 2. DOF number (1=x,2=y,3=z) 3. Coordinate system (1=aero, 2=blade, 3=global, 4=rotor polar)	No
inipos	Initial position of sections in blade coo [m] 1. Blade number 2. DOF number (1=x,2=y,3=z)	No
position	Actual position of section [m] 1. Blade number 2. DOF number (1=x,2=y,3=z) 3. Coordinate system (1=aero, 2=blade, 3=global, 4=rotor polar)	No
velocity	Actual velocity of section [m/s] 1. Blade number 2. DOF number (1=x,2=y,3=z) 3. Coordinate system (1=aero, 2=blade, 3=global, 4=rotor polar)	No

Command 1	Explanation	Label option
acceleration	Actual acceleration of section [m/s] 1. Blade number 2. DOF number (1=x,2=y,3=z) 3. Coordinate system (1=aero, 2=blade, 3=global, 4=rotor polar)	No
ct_local	Local thrust coefficient [-]. Calculated based on the expression $C_t = \frac{F_{axial} B}{\frac{1}{2} \rho 2\pi r V_{inf}^2}$ 1. Blade number	No
cq_local	Local tangential force coefficient [-]. Calculated based on the expression $C_q = \frac{F_{tan} B}{\frac{1}{2} \rho 2\pi r V_{inf}^2}$ 1. Blade number	No
chord	Chord length [m] 1. Blade number	No
induc	Induced velocity [m/s] 1. Blade number 2. DOF number (1=x,2=y,3=z) 3. Coordinate system (1=aero, 2=blade, 3=global, 4=rotor polar)	No
windspeed	Free windspeed (without induction but incl. tower shadow effects if used) [m/s] 1. Blade number 2. DOF number (1=x,2=y,3=z) 3. Coordinate system (1=aero, 2=blade, 3=global, 4=rotor polar)	No
inflow_angle	Angle of attack + rotation angle of profile related to polar coordinates (not pitching). Unit [deg] 1. Blade number	No
dclalpha	Gradient $dCl/d\alpha$. Unit [deg ⁻¹] 1. Blade number	No
dcddalpha	Gradient $dCd/d\alpha$. Unit [deg ⁻¹] 1. Blade number	No

Risø's research is aimed at solving concrete problems in the society.

Research targets are set through continuous dialogue with business, the political system and researchers.

The effects of our research are sustainable energy supply and new technology for the health sector.
